Accepted 27 March, 2012.

Triphala (TPL) is one of the oldest used polyherbal preparations. It is comprised of Terminalia chebula, Terminalia bellerica and Emblica officinalis. A variety of uses, such as anti-obesity, of TPL have been described in Ayurvedic and Al-Qanoon Feltab literature. This study focuses on the efficacy and safety of triphala in medicines, with any outcome in humans and animals; and described some of the mechanisms responsible for the many effects of this traditional medicine and main phytochemical analysis. The databases searched include Google Scholar, PubMed, Web of Science, the search terms were “TPL” and “trifala” without narrowing or limiting search elements. The benefits of TPL in vivo and in vitro include: antioxidant, anti-hypercholesterolemic, anti-diabetic, anti-obesity, chemo-preventive potential and anti-mutagenic activity, anti-inflammatory, antimicrobial, radioprotective effect, immunomodulatory, improving wound healing, enteroprotective efficacies, anti gastric ulcers and nitric oxide scavenging activity. This herbal combination can have profound healing benefits in multi-organ systems. And, it exhibits a number of health benefits like antioxidant activity, lowers cholesterol. It is rich in Mg, K, Ca, Fe, Se and Zn, which enhance their bioavailability. TPL may be potent therapeutic agents for scavenging of NO and thereby help to explain, rejuvenating, adaptogenic, cardioprotective and neuroprotective activities of these traditional, and clinically used non toxic drugs.

Key words: Triphala, Emblica officinalis, Terminalia chebula, Terminalia bellerica, traditional medicine, anti-diabetic, antioxidant, anti-obesity, anti-mutagenic activity.

INTRODUCTION

Recently, complementary therapies are being used increasingly worldwide. When conventional medicine fails to treat chronic diseases efficaciously and without adverse events, many people seek unconventional therapies including herbal medicine (Hasani-Ranjbar et al., 2009).

Triphala (TPL) is one of the oldest and most commonly used polyherbal preparations in the Indian system of
tri = three and phala = fruits), include the Arabicized “Atrifal” and the Chinese term “San-Teng” (Mahdihassan, 1978). This preparation is composed of three equal proportion (Sabu et al., 2002; Ibn-e-sina, 2005) of herbal fruits: *Terminalia chebula*, *Phyllanthus emblica*, and *Terminalia belerica* (Baliga, 2010; Ibn-e-sina., 2005).

A variety of therapeutic effects have been described in Ayurvedic for TPL including cardiovascular disorders, liver dysfunction, and for inflammation (Garg et al., 2005). TPL has been considered as an anti-obesity preparation in Al-Qanun Fit-Tib (Ibn-e-sina, 2005). Since there is no evidence based approach to show the beneficial effects of these formulation in vitro and in vivo trials, here we present the results of our systematic review on TPL to show the efficacy and safety of this medicinal plant in humans and animals.

**METHODOLOGY**

The databases searched include Google Scholar, PubMed, Web of Science, Cochrane library, SID, upToDate, irandoc and IranMedex up to July 8, 2011. The search terms were “TPL” and “trifala” without narrowing or limiting search elements. All human and animal studies that included the evidences of the effects of TPL with any outcome were selected for review. Clinical trials (any phase) were identified for data abstraction and observational studies. Only publications without available abstracts and letters to the editor were excluded from review. Unpublished data was also excluded from study. Duplication was avoided by excluding review of multiple copies of the same article in several databases.

**RESULTS**

Summary of references retrieved from databases included in the study are shown in Figure 1. This review for the first time summarizes these results, with emphasis on published observations. The efficacy and safety of TPL is summarized in Table 1.

**Antioxidant**

Many studies (Luo et al., 2011; Naik et al., 2004, 2005a, b; Shivaprasad et al., 2008; Singh et al., 2010; Palav et al., 2006; Perera et al., 2008; Pfundstein et al., 2010; Vani et al., 1997) have assessed the antioxidant activity of TPL. The antioxidant activities were determined by 1,1-diphenyl-2-picryl-hydrazyl (DPPH) method and inhibition of lipid peroxide formation induced by Fe"ascorbate system. They were found to strongly correlate with total polyphenol contents (Palav et al., 2006). Mallotusinin and mucic acid 1, 4-lactone 3-O-gallate were reported to have antioxidant activity (Luo et al., 2011). TPL has been found to be an excellent scavenger of hydroxyl radicals and nitric oxide radicals and is capable of increasing the capacity to tolerate non-specific stress in experimental animals (Shivaprasad et al., 2008). TPL was also effective in preventing superoxide-induced haemolysis of red blood cells (Vani et al., 1997).

**Anti hypercholesterolemic**

Hypercholesterolemia is one of the risk factors for coronary artery diseases (Saravanan et al., 2007). Several studies assessed the efficacy of herbal formulation TPL on total cholesterol, low density lipoprotein (LDL), very low density lipoprotein (VLDL), high density lipoprotein (HDL), and free fatty acid, experimentally and the results showed significant decreases in the total cholesterol and LDL (Nalini et al., 1999; Saravanan et al., 2007), VLDL and free fatty acid (Saravanan et al., 2007), and triglycerides (Nalini et al., 1999) in hypercholesterolemic rats on treatment with TPL (Nalini et al., 1999; Saravanan et al., 2007). HDL cholesterol remained unchanged and excretion of bile acids was found to be significantly (p < 0.01) higher in animals receiving the TPL (Nalini et al., 1999). In another study of a randomized, double blind

| Animal STUDY | TPL, that inhibited 50% of lipid peroxidation induced with Fe2+/ascorbate were food to be 85.5, 27, 74 and 69 mug/ml, respectively. The concentration needed for the inhibition of hydroxyl radical scavenging were 165, 71, 155.5 and 151 mug/ml, and that for superoxide scavenging activity were found to be 20.5, 40.5, 6.5 and 12.5 mug/ml, respectively. Oral administration of the extracts (100 mg/kg body weight) reduced the blood sugar level in normal and in alloxan (120 mg/kg) diabetic rats significantly within 4 hours. Continued, daily administration of the drug produced a sustained effect. | Anti-diabetic activity of medicinal plants and its relationship with their antioxidant property. | Sabu et al., 2002 |
| Anti-obesity | TPL have been reported to contain gallic acid. Gallic acid is a widely occurring phenolic compound of plant origin. Gallic acid is selected as a bioactive marker due to its easy availability, common presence in these fruits and as anti obesity property. There was significant variation in gallic acid content of fruit collected from different regions. Gallic acid was maximum in Phyllanthus emblica Linn. | Quantitation of Gallic Acid from Fruits of Phyllanthus emblica Linn., Terminalia bellirica (Gaertn.) Roxb. and Terminalia chebula Retz. | Sharma et al. 2009 |
| Chemopreventive potential and antimutagenic activity | The decoctions D1( Terminalia bellerica, Terminalia chebula, Phyllanthus emblica and detoxified Commiphora mukul) and D2 ( Terminalia bellirica, Terminalia chebula, Phyllanthus emblica, detoxified Commiphora mukul, Smilax china and Nigella sativa) showed strong inhibition of cell proliferation against Rhabdomysosarcoma cells. The chemo preventive and therapeutic potential of the decoctions D1 and D2 can be explained to a certain extent by the results obtained from this study. | Antioxidant and cytotoxic properties of three traditional decoctions used for the treatment of cancer in Sri Lanka. | Perera et al., 2008 |
| In vitro | The MCF 7 and T 47 D cells (breast cancer cell lines) exhibited differential sensitivity to TPL, which seem to depend on their p53 status. Inhibition of anti-proliferative ability of TPL by antioxidants suggests a role for TPL induced ROS in the induction of apoptosis. | Cytotoxic response of breast cancer cell lines, MCF 7 and T 47 D to triphala and its modification by antioxidants. | Sandhya et al., 2006a |
| In vitro | The cytotoxic effects of aqueous extract of TPL were investigated on human breast cancer cell line (MCF-7) and a transplantable mouse thymic lymphoma (barcl-95). The viability of treated cells was found to decrease with the increasing concentrations of TPL. These results suggest that TPL possessed the ability to induce cytotoxicity in tumor cells but spared the normal cells. | Potential of traditional ayurvedic formulation, Triphala, as a novel anticancer drug. | Sandhya et al., 2006c |
| In vitro and in vivo | In the case of long term treatment the tumor incidences were reduced to 66.66% and 62.50% respectively by 2.5% and 5% TPL containing diet. Tumor burden was 7.27 +/- 1.16 in the B(a)P treated control group, whereas it reduced to 3.00 +/- 0.82 (p<0.005) by 2.5% dose and 2.33 +/- 1.03 (p<0.001) by 5% dose of TPL. In long-term studies the tumor burden was reduced to 2.17 +/- 0.75 (p<0.001) and 2.00 +/- 0.71 (p<0.001) by 2.5% and 5% diet of TPL, respectively. | Chemopreventive potential of Triphala (a composite Indian drug) on benzo(a)pyrene induced forestomach tumorigenesis in murine tumor model system. | Deep et al., 2005 |

TPL: Triphala Polyherbal drug
### Correcting menstrual irregularities

- **Open clinical trial**
  - This was studied on 50 women, suffering from menstrual irregularities, in an open, prospective clinical study. The drug was administered through oral route at a dose of 10 ml b.i.d. for 90 days. Majority of the subjects (61.54%) with increased duration of cycles showed mean reduction of days from baseline to end of the study. The trial drug was also found to be effective in reducing the increased flow, which was clinically significant. All the subjects failing under both irregular cycle duration and irregular bleeding days reflected relief from the respective clinical symptoms. The study reveals that the preparation could be effective in correcting menstrual irregularities.

  - Tandon et al., 2010

### Anticataract potential of Triphala

- **In vitro and in vivo**
  - Gupta et al., 2010

### Abbreviations

- FPT: foot pad thickness; LMI: leukocyte migration inhibition; HD: hypercholesterolemia diet; FPG: fasting plasma glucose; MIC: minimum inhibitory concentration; MTX: methotrexate.
placebo controlled trial showed that the LDL/HDL cholesterol ratio significantly declined; fasting and postprandial blood glucose as well as lipid peroxides and diene conjugates (indicators of oxidative stress) significantly decreased in the TPL group whereas these changes were not significant in the placebo group and the results also showed antioxidant effects (Singh et al., 1998).

**Anti-diabetic activity**

Some studies have investigated the possible anti-diabetic properties of combination TPL in animal models (Prativadibhayankaram et al., 2008; Sabu et al., 2002), one in a high fructose diet induced (Prativadibhayankaram et al., 2008) and another in alloxan diabetic rats. The results of these studies show that the administration of the extracts reduced the blood sugar level (Prativadibhayankaram et al., 2008; Sabu et al., 2002). They were found to inhibit lipid peroxide formation and to scavenge hydroxyl and superoxide radicals in vitro (Prativadibhayankaram et al., 2008).

**Anti-obesity**

One study which evaluated the herbal formulation TPL in mice showed that the body weight was found to be reduced when compared with the control animals (Rasool et al., 2000). Gallic acid is a phenolic compound of TPL which is selected as a bioactive marker due to its easy availability, and its anti-obesity property (Sharma et al., 2009).

In our view, sufficient clinical data are available to qualify certain TPL preparations for the category of well-established medicinal products, fulfilling the requirements for well-established use defined in the assessment of clinical safety and efficacy in the preparation of TPL for well-established entries to the list for traditional herbal medicinal products, substances, and preparations. Accordingly, a randomized, double-blind, placebo-controlled, clinical safety and efficacy trial at Shahed University in collaboration with Endocrinology and Metabolism Research Institute (EMRI) has being conducted for evaluation of the activity of TPL in obesity implementation (unpublished data).

**Chemo-preventive potential and anti-mutagenic activity**

Many studies showed that TPL is useful in the prevention of cancer and possesses anti-neoplastic, radio-protective and chemo-protective properties (Arora et al., 2003, 2005; Baliga., 2010; Deep et al., 2005; Kaur et al., 2002, 2005; Sandhya et al., 2006a, c; Shi et al., 2008; Perera et al., 2008). The aqueous extract, induced apoptosis in Capan-2 cells and in pancreatic cancer cell. And reduced tumor-growth in TPL fed mice. On the other hand, TPL failed to induce apoptosis or activate extracellular signal-regulated kinase (ERK) or phosphorylation of p53 (p53) in normal human pancreatic ductal epithelial (HPDE-6) cells (Shi et al., 2008). TPL was found to induce apoptosis in MCF-7 and barcl-95 cells in vitro. Treated MCF-7 and barcl-95 cells had significant increase in intracellular reactive oxygen species (ROS). The differential effect of TPL on normal and tumor cells seems to be related to its ability to evoke differential responses in intracellular ROS generation. This effect suggests potential use as an anticancer drug for clinical treatment (Sandhya et al., 2006c). The anti-proliferative ability by antioxidants suggests a role for TPL induced ROS in the induction of apoptosis and also significantly increased the antioxidant status of animals which might have contributed to the hemoprevention (Sandhya et al., 2006a).

One study has shown that TPL in diet has significantly reduced the benzo(a)pyrene induced fore-stomach papillomagenesis in mice. Moreover, TPL was effective in reducing tumor incidences (Deep et al., 2005). The suppression of the growth of cancer cells may be due to the gallic acid (Kaur et al., 2005). All the extracts were found to have potent antimutagenic effects against the direct acting mutagens 4-nitro-o-phenylenediamine, sodium azide, S9-dependent mutagen, and 2-aminofluorene (2AF) (Arora et al., 2005). Antimutagenic activities of the extracts were more effective against indirect acting mutagen, than against the direct acting mutagens (Arora et al., 2003). In addition a significant inhibition of 98.7% was observed with acetone extract against the revertants induced by S9-dependent mutagen, 2AF, in co-incubation mode of treatment (Kaur et al., 2002). Also, strong inhibition of cell proliferation against rhabdomyosarcoma cells has been shown (Perera et al., 2008).

**Radioprotective effect**

The radioprotective effect of TPL have been shown in many studies (Naik et al., 2005a; Jagetia et al., 2004a, 2002; Sandhya et al., 2006c). In one of these studies, aqueous extract was studied on the radiation-induced mortality. The treatment of mice with different doses before irradiation delayed the onset of mortality and reduced the symptoms of radiation sickness. 10 mg/kg TPL intraperitoneally (i.p) was found to provide the best protection as evidenced by the highest number of survivors after 30 days post-irradiation. The LD50 i. p. dose of TPL was found to be 280 mg/kg. This study demonstrated the ability of TPL as a good radioprotective agent and the optimum protective dose of TPL was 1/28
of its LD50 dose (Jagetia et al., 2002).

**Immunomodulatory activity**

Many studies have assessed the immunomodulatory effects of TPL on stress (Abraham et al., 2005; Shivaprasad et al., 2005, 2006; Srikumar et al., 2005, 2006, 2007). Stress results in immunu dysfunction (Srikumar et al., 2007). Neutrophil functions were significantly enhanced in the TPL immunized group and a significant decrease in corticosterone level was observed (Srikumar et al., 2005). According to the results of these trials, stress significantly increased the lipid peroxidation (LPO) and corticosterone level with concomitant depletion of antioxidants in plasma and tissues (Srikumar et al., 2006). One study on noise-stress in male albino rats indicated that elevation in the serum antibody titer and IL-4 levels associated with decreased IL-2, IFN-gamma, and reduction in Pan T, CD4(+)/CD8(+) lymphocyte phenotype in the spleen were significantly prevented in TPL treated noise-stress exposed group (Srikumar et al., 2007). Another study evaluated the inhibitory activity of TPL on PMN-type matrix metalloproteinase (MMP-9) expressed in adult periodontitis patients. This study showed a 76.6% reduction of MMP-9 activity (Abraham et al., 2005) and ‘TPL’ showed a significant increase in neutrophil adhesion and delayed type hypersensitivity response (Shivaprasad et al., 2005).

**Miscellaneous activities**

**Antimicrobial activity**

Many studies have been conducted on TPL that are effective against multiple human pathogens (Amarasingha et al., 2007; Biradar et al., 2008a; Madani et al., 2008; Zafar et al., 2000; Mehrtra et al., 2010; Nageeb et al., 2010; Prabhakar et al., 2010; Srikumar et al., 2007; Sumathi and Parvathi, 2010), and also showed significant antibacterial activity against 32 different strains of *Salmonella typhi* (Sumathi and Parvathi, 2010).

**Anti-inflammatory**

Several studies have evaluated the antiarthritic effect of TPL (Prabhakar et al., 2010; Rasool et al., 2000). One study indicated that gallic acid is a selective inhibitor of COX-2. Being a small natural product with selective and reversible inhibition of COX-2, gallic acid would form a lead molecule for developing potent anti-inflammatory drug (Prabhakar et al., 2010). TPL treatment significantly inhibited the levels of lysosomal enzymes, LPO and inflammatory mediator tumor necrosis factor-alpha; however the anti-oxidant status was found to have increased in plasma, liver and spleen (Sabina et al., 2008).

**Wound healing**

TPL has shown *in vitro* wound healing activity (Kumar et al., 2008, 2010). In one study, an infected wound was dressed with TPL (methanol extract). The study revealed that matrix metalloproteinases expression was correlated well with reduction in the inflammatory phase, thus confirming efficacy of the dressing (Kumar et al., 2010). Another study showed *in vitro* activity against wound pathogens such as *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Streptococcus pyogenes*. Reduction of matrix MMP expression was observed in the treated group by gelatin zymography (Kumar et al., 2008).

**Enteroprotective efficacies and anti-diarrheal**

The enteroprotective efficacies, examined the comparative against methotrexate-induced intestinal damage in rats. This study showed that TPL unequal formulation provides significantly more protection than TPL equal formulation (Nariya et al., 2009). The antidiarrheal effects of aqueous and alcoholic extracts of TPL were studied employing castor oil-induced-diarrheal model in rats. These studies showed that TPL has remarkable anti-diarrheal effects (Biradar et al., 2008b).

**Nitric oxide scavenging activity**

Various polyherbal drugs exhibited dose-dependent NO scavenging activities and thereby inhibit the pathological conditions caused by excessive generation of NO and its oxidation product and peroxynitrite. These findings revealed pharmacological activities like rejuvenating, adaptogenic, anti-infection, anti-inflammatory, cardioprotective and neuroprotective activities of these traditional and clinically used non toxic drugs (Jagetia et al., 2004b).

**Anti gastric ulcers activity and alleviate catalepsy**

The evaluated anti-ulcer efficacy of the polyherbal formulation NR-ANX-C (composed of the extracts from *Withania somnifera*, *Camellia sinensis*, *Ocimum sanctum*, shilajit and TPL) presume that the cytoprotective, anti-secretory and antioxidant properties of NR-ANX-C were responsible for its anti-ulcer activity (Nair et al., 2010). In one study, catalepsy was induced by intraperitoneally administration of haloperidol, and degree of catalepsy (cataleptic score) was measured as the time the animal maintained an imposed posture. The study compared the anticataleptic efficacy of NR-ANX-C with scopolamine.
The SOD level in brain tissue was also estimated to be correlated with the levels of oxidative stress and degree of catalepsy in the animal. Findings suggest antioxidant potential of NR-ANX-C in alleviating haloperidol induced catalepsy (Nair et al., 2007).

DISCUSSION

TPL consists of the three myrobalans, *T. chebula* (Haritaki), *T. belerica* (Bibhitaki), and *P. emblica* or *Emblica officinalis* (Amalaki or the Indian gooseberry) (Baliq, 2010). The formulation generally contained of equal proportions of wall of a fruit of these myrobalans (Ibn-e-sina, 2005). Phytochemical analysis of TPL is rich in phenols/polyphenols (38 ± 3%) and tannins (35 ± 3%) (Arora et al., 2003; Naik et al., 2006), while flavonoids were found to be absent (Naik et al., 2006). High-pressure liquid chromatography (HPLC) analysis showed the presence of compounds such as ascorbate (Naik et al., 2004; Pawar et al., 2009), and ellagic acid (Naik et al., 2004, Pratavidbhayankaram et al., 2008), chebulagic acid and chebulinic (Pawar et al., 2009; Luo et al., 2011), mucic acid, 1,4-lactone 3-O-gallate, isocorilagin, mallowsin were isolated and purified from this plant (Luo et al., 2011). Availability of many nutrient elements such as Mg, Ca, K, Fe, and Se in TPL (Garg et al., 2005) and powder was rich in Cr, Fe, Se and Zn, whereas the tablet contained a fours-fold higher Mn compared to the powder (Choudhury et al., 2007). In addition, efficient separation of gallic acid has been shown in some trials (Naik et al., 2004; Pawar et al., 2009; Garg et al., 2005; Jadon et al., 2007). HPLC analysis showed that it contains 73 ± 5 mg gallic acid per gram of triphala (Naik et al., 2006) and gallic acid as the major component (Kaur et al., 2005). The choice of the solvent system toluene-ethyl acetate-formic acid is discussed and its utility is demonstrated for complete resolution of gallic acid from other components. Gallic acid therefore can be used as a marker compound for standardizing TPL (Bahulikar et al., 2003). Gallic acid may be useful in quality control and standardization of several herbal formulations and crude drugs containing phenolics and tannins (Ahmad et al., 2011). These analyses showed tannic acid, syringic acid and epicatechin along with ascorbic acid (Garg et al., 2005). The major phenolic compounds of the alcohol extracts were confirmed as tannins (Vani et al., 1997).

Accumulation of heavy metals including arsenic content in herbal formulations is below the permissible limit in all formulations. The lead content is below detectable level in all formulations (Bais et al., 2011). Besides, aqueous and alcoholic extracts of TPL were considered safe up to a dose of 1750 mg/kg when evaluated for acute oral toxicity in accordance with the Organization for Economic Cooperation and Development guidelines (Biradar et al., 2008b) and clinically used non toxic drugs (Dhanalakshmi et al., 2006).

Some of the experimental studies have shown that the mechanisms responsible for the many effects of TPL such as increase in antioxidant enzymes (Sandhya et al., 2006b), increase in free radical scavenging activity (Jagetia et al., 2004b), selective apoptosis, superoxided dimutase(SOD), catalase (Deep et al., 2005), glutathione (Deep et al., 2005), decrease in oxidative stress, lipid peroxidation (Naik et al., 2005a), inflammation (Rasool et al., 2000), lactate dehydrogenase and xanthine oxanthine reductase (Sandhya et al., 2006b).

Conclusion

It is important for us, in medicine, to recognize that many of the traditional formulation contain healing potentials. TPL has shown itself to be one of these herbal combinations. This herbal combination can have profound healing benefits in multi-organ systems and exhibits a number of health benefits like antioxidant activity, anti hyperlipidemia, reducing tumors in animals and so on. TPL is rich in Mg, K, Ca, Fe, Se and Zn, and the presence of gallic acid and polyphenols enhance their bioavailability (Jadon et al., 2007). Studies indicate that TPL may be a potent and novel therapeutic agent for scavenging of NO, and thereby inhibit the pathological conditions caused by excessive generation of NO and its oxidation product and peroxynitrite. These findings may also help to explain, at least in part, the pharmacological activities like rejuvenating, adaptogenic, anti-infection, anti-inflammatory, cardioprotective and neuroprotective activities of this traditional, and clinically used non toxic drug (Pinmai et al., 2008). Since, free radicals have been implicated in the causation of several diseases such as liver cirrhosis, atherosclerosis, cancer, and diabetes, it is obvious that this mixture which could scavenge free radicals have great potential in improving these disease processes (Wilson, 1998).

Trials to validate the experimentally observed of many effects of TPL need to be performed, as then the efficacy will be clearly understood. Further pharmacological evidences at molecular level are required to establish the mechanism of the action of this polyherbal medicine.
