Oleander is an evergreen shrub or small tree from 5 to 25-ft tall containing gummy sticky sap in the dogbane family Apocynaceae. In this study, the alkaloid compounds of *Nerium oleander* (NO) have been evaluated. The chemical compositions of the leaf ethanol extract of *N. oleander* were investigated using gas chromatography-mass spectroscopy (GC-MS). GC-MS analysis of *N. oleander* alkaloid leaf ethanol extract revealed the existence of the 5-hydrooxy methylfurfural, β-d-allopyranoside, methyle 6-dioxy-2-o methyl, cycloheptasiloxane, tetradecamethyle, cyclooctasiloxane, hexadecamethyl, cyclononasiloxane, octadecamethyl, cyclodecasiloxane, eicosamethyl, 2-cyclopenten-1-one, 2-hydroxy-3-methyl, 9.12.15-octadecatrienoic acid, 2,3bis[trimethylsilyl]oxy] propyl ester, octadecane, 3-ethyl-5-(2-ethylbutyl), 1-monolinoleoylglycerol trimethylsilyl ether, 1.1.3.3.5.5.7.7.9.9-decamethyl-3-(2-methyl propoxy)pentasiloxane, 2-cyclohexen-1-one, 4-(hydroxybutyle)-3.5.5-trimethyl, octasiloxane, 1.1.3.3.5.5.7.7.9.9.11.11.13.13.15.15-hexadecamethyl and 3-eicosene. Eight chemical alkaloids constituents have been identified from methanolic extract of the *Nerium oleander*.

**Key words:** Alkaloids, methanol, gas chromatography-mass spectroscopy (GC-MS) analysis, *Nerium oleander*.

**INTRODUCTION**

*Nerium oleander* (NO), common as wild plant in stony torrent beds or dry rocky valleys in foothills of Kurdistan up to altitude 800 m and as ornament plant throughout the country (Figure 1). The leaves contain nerii and oleandrin. Oleandrin is 3-glucoside-16-acle derivative of gitoxigenin. They are poison to man, sheep, goat, cattle and horses. Root, bark and seeds contain the toxic principles neriodorin and karabin. The effects of poison are nausea, vomiting, colic dizziness, decreased pulse rate, irregular heart action, bloody diarrhea, and respiratory paralysis and death. Oleander is originally a Mediterranean and Asian plant and is widely distributed in the world, especially in tropical and subtropical regions. The plant is grown throughout Iran and is more common in eastern and southern provinces (Aslani, 2004). Oleander has long been known to be poisonous to animals and human beings. All parts of the plant either fresh or dried are toxic and contain cardiac glycosides,
where the roots and seeds having the highest concentrations. Themost prominent of those glycosides are oleandrin and nerin (Aslani et al., 2007).

The main cardiac glycoside of *N. oleander* is oleandrin with a molecular formula of C_{32}H_{48}O_{9} and a molecular mass of 576.3. The common oleander is one of the most poisonous plants that have been shown to contain digitalis cardiac glycosides. Oleander is an idiom for plants of the *Nerium oleander* L, *Nerium indicum*, and *Nerium odorum* species. Common names include soland, lorier bol, rosebay, and rose laurel and kaner (Sazada et al., 2009). All parts of the oleander plant contain cardiac glycosides, including the roots and the smoke produced from burning, as heat does not inactivate the glycosides.

The toxic components are the two potent cardiac glycosides; oleanderin and nerin, which can be isolated from all parts of the plant, both are very similar to the toxin of Foxglove (Shumaik et al., 1988; Cheeke, 1998; Singh et al., 1998). Oleandrin and nerin are the most potent of those glycosides (Longforad and Boor, 1996; Aslani et al., 2004). Oleander is one of the most toxic and lethal plants in birds. Accidental and/or experimental cases of oleander poisoning have been described in several species, including cattle (Aslanl and Rezakhani, 2000; Soto-Blanco et al., 2006), sheep (Adam et al., 2002), goats (Aslani et al., 2007; Barbosa et al., 2008), camels (Kozikowski et al., 2009), horses (Huges et al., 2002), donkeys (Smith et al., 2003), cats (Giuliano and Nebbia, 2004), dogs (Szabuniewicz et al., 1972), monkeys (Schwartz et al., 1974), turkeys, geese (Alfonso et al., 1994), canaries (Arai et al., 1992), ducks and budgerigars (Shropshire et al., 2003). The objective of this study was to determine the alkaloid compounds of *N. oleander*.

**MATERIALS AND METHODS**

**Collection and preparation of plant**

*N. oleander* leaves were collected from Hilla city Iraq. After collection of the required quantity of the plant material, it was then carefully segregated, cleaned and dried in shade to constant weight. The completely dried plant material free of moisture was powdered and sieved through a BSS Mesh No. 85 sieve and then stored in an airtight plastic container. Fresh aerial parts of plant were collected for preparation of decoction.

**Extraction and identification of alkaloids**

The powdered leaves (2 g) were boiled in a water bath with 20 ml of 5% sulphuric acid in 50% ethanol. The mixture was cooled and filtered. A portion was reserved. Another portion of the filtrate was put in 100 ml of separating funnel and the solution was made alkaline by adding two drops of concentrated ammonia solution. Equal volume of chloroform was added and shaken gently to allow the layer to separate. The lower chloroform layer was run off into a second separating funnel. The ammoniac layer was reserved. The chloroform layer was extracted with two quantities each of 5 ml of dilute sulphuric acid. The various extracts were then used for the following test:

**Wagner’s test:** To the filtrate in tube III, 1 ml of Wagner’s reagent was added drop by drop. Formation of a reddish-brown precipitate indicates the presence of alkaloids (Evans, 2002).

**Dragendoff’s test:** To the filtrate in test tube II, 1 ml of Dragendoff’s reagent was added drop by drop. Formation of a reddish-brown precipitate indicates the presence of alkaloids (Evans, 2002).

**Mayer’s test:** To the filtrate in test tube I, 1 ml of Mayer’s reagent was added drop by drop. Formation of a greenish coloured or cream precipitate indicates the presence of alkaloids (Evans, 2002).

**Gas chromatography-mass spectroscopy (GC-MS) analysis**

GC-MS analysis of the methanol extract of *N. oleander* was carried out using a Clarus 500 Perkin-Elmer (Auto system XL) Gas Chromatograph equipped and coupled to a mass detector Turbo Mass Gold Perkin-Elmer Turbo Mass 5.1 spectrometer with an elite – 1 (100% Dimethyl poly siloxane), 30 m × 0.25 mm ID × 1 μm of capillary column. For GC-MS detection, an electron ionization system was operated in electron impact mode with ionization system, and was operated in electron impact mode with ionization energy of 70 eV. The instrument was set to an initial temperature of 110°C, and maintained at this temperature for 2 min. At the end of this period, the oven temperature rose up to 280°C, at the rate of an increase of 5°C min⁻¹, and maintained for 9 min. Helium gas (99.999%) was used as carrier gas at a constant flow rate of 1 ml/min, and an injection volume of 2 ml was employed (split ratio of 10:1). The injector temperature was maintained at 250°C, the ion-source temperature was 200°C, the oven temperature was programmed at 110°C (isothermal for 2 min), with an increase of 100°C min⁻¹ to 200°C, then 5°C min⁻¹ to 280°C, ending with a 9 min isothermal at 280°C. Mass spectra were taken at 70 eV; a scan interval of 0.5 s and fragments from 45 to 450 Da. The solvent delay was 0 to 2 min and the total GC-MS running time was 36 min. The samples were injected in split mode as 10:1. Mass spectral scan range was set at 45 to 450 (m/z). The mass detector used in this analysis was Turbo-Mass Gold-Perkin Elmer and the software adopted to handle mass spectra and chromatograms was a Turbo-Mass ver 5.2 (Imad et al., 2014b; Imad et al., 2015b; Mohammed et al., 2015).

**RESULTS AND DISCUSSION**

GC-MS analysis of alkaloid compound clearly showed the presence of fifteen compounds. The alkaloid compound, formula, molecular weight and exact mass are as shown in Table 1. The GC-MS chromatogram of the 15 peaks of the compounds detected are as shown in Figure 2. Chromatogram GC-MS analysis of the methanol extract of *N. oleander* showed the presence of fifteen major peaks and the components corresponding to the peaks were determined as follows. The first set up peaks were determined to be 5-hydroxy methyllumurfural, β-d-allopyranoside as shown in Figure 3. The second peaks indicated to be methyl 6-dioxy-2-o methyl (Figure 4). The next peaks was considered to be cycloheptasiloxane, tetradecamethyle, cyclooctasiloxane, hexadecamethyl, cyclononasiloxane, octadecamethyl, cyclodecasiloxane, eicosamethyl, 2-cyclopenten-1-one, 2-hydroxy-3-methyl, 9.12.15-octadecatrienoic acid 2,3bis

Among the identified phytocompounds have the property of anti oxidant and antimicrobial activities (Kumar et al., 2001; Avci and Dik, 2014; John and Senthilkumar, 2005; Venkatesan et al., 2005; Santh, 2006). Plant based antimicrobials have enormous therapeutic potential as they can serve the purpose with lesser side effects. Continued further exploration of plant derived antimicrobials is needed today.

**Conclusion**

Fifteen chemical alkaloids constituents have been
