ABOUT JEBR

The Journal of Evolutionary Biology Research (JEBR) (ISSN 2141-6583) is published Monthly (one volume per year) by Academic Journals.

Journal of Evolutionary Biology Research (JEBR) is a peer reviewed journal. The journal is published per article and covers all areas of of the subject such as: Mating Systems and Strategies, Trends in Ecology and Evolution, Genetical Evolution of Social Behaviour, Genetic drift and Biased mutation.

Submission of Manuscript

Please read the Instructions for Authors before submitting your manuscript. The manuscript files should be given the last name of the first author.

Click here to Submit manuscripts online

If you have any difficulty using the online submission system, kindly submit via this email ajb@academicjournals.org.

With questions or concerns, please contact the Editorial Office at jebr@academicjournals.org.

Instructions for Author

Electronic submission of manuscripts is strongly encouraged, provided that the text, tables, and figures are included in a single Microsoft Word file (preferably in Arial font).

The cover letter should include the corresponding author’s full address and telephone/fax numbers and should be in an e-mail message sent to the Editor, with the file, whose name should begin with the first author’s surname, as an attachment.

Article Types
Three types of manuscripts may be submitted:

Regular articles: These should describe new and carefully confirmed findings, and experimental procedures should be given in sufficient detail for others to verify the work. The length of a full paper should be the minimum required to describe and interpret the work clearly.

Short Communications: A Short Communication is suitable for recording the results of complete small investigations or giving details of new models or hypotheses, innovative methods, techniques or apparatus. The style of main sections need not conform to that of full-length papers. Short communications are 2 to 4 printed pages (about 6 to 12 manuscript pages) in length.

Reviews: Submissions of reviews and perspectives covering topics of current interest are welcome and encouraged. Reviews should be concise and no longer than 4-6 printed pages (about 12 to 18 manuscript pages). Reviews are also peer-reviewed.

Review Process
All manuscripts are reviewed by an editor and members of the Editorial Board or qualified outside reviewers. Authors cannot nominate reviewers. Only reviewers randomly selected from our database with specialization in the subject area will be contacted to evaluate the manuscripts. The process will be blind review. Decisions will be made as rapidly as possible, and the journal strives to return reviewers’ comments to authors as fast as possible. The editorial board will re-review manuscripts that are accepted pending revision. It is the goal of the AJFS to publish manuscripts within weeks after submission.

Regular articles
All portions of the manuscript must be typed double-spaced and all pages numbered starting from the title page.

The Title should be a brief phrase describing the contents of the paper. The Title Page should include the authors’ full names and affiliations, the name of the corresponding author along with phone, fax and E-mail information. Present addresses of authors should appear as a footnote.

The Abstract should be informative and completely self-explanatory, briefly present the topic, state the scope of the experiments, indicate significant data, and point out major findings and conclusions. The Abstract should be 100 to 200 words in length. Complete sentences, active verbs, and the third person should be used, and the abstract should be written in the past tense. Standard nomenclature should be used and abbreviations should be avoided. No literature should be cited. Following the abstract, about 3 to 10 key words that will provide indexing references should be listed.

A list of non-standard Abbreviations should be added. In general, non-standard abbreviations should be used only when the full term is very long and used often. Each abbreviation should be spelled out and introduced in parentheses the first time it is used in the text. Only recommended SI units should be used. Authors should use the solidus presentation (mg/ml). Standard abbreviations (such as ATP and DNA) need not be defined.

The Introduction should provide a clear statement of the problem, the relevant literature on the subject, and the proposed approach or solution. It should be understandable to colleagues from a broad range of scientific disciplines.

Materials and methods should be complete enough to allow experiments to be reproduced. However, only truly new procedures should be described in detail; previously published procedures should be cited, and important modifications of published procedures should be mentioned briefly. Capitalize trade names and include the manufacturer’s name and address. Subheadings should be used. Methods in general use need not be described in detail.
Results should be presented with clarity and precision. The results should be written in the past tense when describing findings in the authors’ experiments. Previously published findings should be written in the present tense. Results should be explained, but largely without referring to the literature. Discussion, speculation and detailed interpretation of data should not be included in the Results but should be put into the Discussion section.

The Discussion should interpret the findings in view of the results obtained in this and in past studies on this topic. State the conclusions in a few sentences at the end of the paper. The Results and Discussion sections can include subheadings, and when appropriate, both sections can be combined.

The Acknowledgments of people, grants, funds, etc should be brief.

Tables should be kept to a minimum and be designed to be as simple as possible. Tables are to be typed double-spaced throughout, including headings and footnotes. Each table should be on a separate page, numbered consecutively in Arabic numerals and supplied with a heading and a legend. Tables should be self-explanatory without reference to the text. The details of the methods used in the experiments should preferably be described in the legend instead of in the text. The same data should not be presented in both table and graph form or repeated in the text.

Figure legends should be typed in numerical order on a separate sheet. Graphics should be prepared using applications capable of generating high resolution GIF, TIFF, JPEG or Powerpoint before pasting in the Microsoft Word manuscript file. Tables should be prepared in Microsoft Word. Use Arabic numerals to designate figures and upper case letters for their parts (Figure 1). Begin each legend with a title and include sufficient description so that the figure is understandable without reading the text of the manuscript. Information given in legends should not be repeated in the text.

References: In the text, a reference identified by means of an author’s name should be followed by the date of the reference in parentheses. When there are more than two authors, only the first author’s name should be mentioned, followed by ‘et al’. In the event that an author cited has had two or more works published during the same year, the reference, both in the text and in the reference list, should be identified by a lower case letter like ‘a’ and ‘b’ after the date to distinguish the works.

Examples:

Abayomi (2000), Agindotan et al. (2003), (Kelebeni, 1983), (Usman and Smith, 1992), (Chege, 1998; 1987a,b; Tijani, 1993,1995), (Kumasi et al., 2001)

References should be listed at the end of the paper in alphabetical order. Articles in preparation or articles submitted for publication, unpublished observations, personal communications, etc. should not be included in the reference list but should only be mentioned in the article text (e.g., A. Kingori, University of Nairobi, Kenya, personal communication). Journal names are abbreviated according to Chemical Abstracts. Authors are fully responsible for the accuracy of the references.

Examples:

Short Communications

Short Communications are limited to a maximum of two figures and one table. They should present a complete study that is more limited in scope than is found in full-length papers. The items of manuscript preparation listed above apply to Short Communications with the following differences: (1) Abstracts are limited to 100 words; (2) instead of a separate Materials and Methods section, experimental procedures may be incorporated into Figure Legends and Table footnotes; (3) Results and Discussion should be combined into a single section.

Proofs and Reprints: Electronic proofs will be sent (e-mail attachment) to the corresponding author as a PDF file. Page proofs are considered to be the final version of the manuscript. With the exception of typographical or minor clerical errors, no changes will be made in the manuscript at the proof stage.
Fees and Charges: Authors are required to pay a $550 handling fee. Publication of an article in the Journal of Evolutionary Biology Research is not contingent upon the author's ability to pay the charges. Neither is acceptance to pay the handling fee a guarantee that the paper will be accepted for publication. Authors may still request (in advance) that the editorial office waive some of the handling fee under special circumstances.

All rights Reserved. In accessing this journal, you agree that you will access the contents for your own personal use but not for any commercial use. Any use and or copies of this Journal in whole or in part must include the customary bibliographic citation, including author attribution, date and article title.

Submission of a manuscript implies: that the work described has not been published before (except in the form of an abstract or as part of a published lecture, or thesis) that it is not under consideration for publication elsewhere; that if and when the manuscript is accepted for publication, the authors agree to automatic transfer of the copyright to the publisher.

Disclaimer of Warranties

Taxonomic Survey Of Crustacean Zooplankton In Wular Lake Of Kashmir Himalaya
Javaid Ahmad Shah and Ashok Kumar Pandit
Short Communication

Taxonomic survey of crustacean zooplankton in Wular Lake of Kashmir Himalaya

Javaid Ahmad Shah* and Ashok Kumar Pandit

Centre of Research for Development, University of Kashmir 190006, J&K, India.

Accepted 9 December, 2013

Taxonomic survey of the crustacean community was conducted at five study sites in Wular Lake. Plankton samples were collected on monthly basis from September 2010 to August 2011 and identified in the laboratory under different magnifications using the Olympus microscope. Of the 42 taxa identified, 23 were Cladocera, 16 were Copepoda and only three were Ostracoda. Among the Copepoda, one taxa namely Cyclops latipes seems to be a new addition which was previously unreported in Kashmir. Cladocera dominated Copepoda followed by Ostracoda in the community throughout the study. However, the species more frequently found in the samples were Chydorus sphaericus, Alona affinis, Bryocamptus minutus and Cyclops bicolor. As per the species composition of crustaceans, Lake Wular is still enjoying the infancy stage of eutrophication.

Key words: Taxonomy, Cladocera, Copepoda, distribution, trophic status, Kashmir.

INTRODUCTION

The zooplankton is a major component of freshwater ecosystems (Gannon and Stemberger, 1978; Sladecek, 1983; Huys and Boxshall, 1991; Devi and Ramanibai, 2012) and as such assumes significant importance. The crustacean zooplankton plays a pivotal role in aquatic food chains, which is an important food item of fishes (Patalas, 1972). They are able to consume great quantities of phytoplankton from the open water zone, thereby influencing the primary production (Tonno et al., 2003). In addition, these planktonic organisms act as bioindicators of the aquatic systems (Gannon and Stemberger, 1978; Bays and Crisman, 1983; Stemberg and Lazorchack, 1994; Attayde and Bozelli, 1998; Pinto-Coelho et al., 2005; Burns and Galbraith, 2007; Davies et al., 2008; Shah and Pandit, 2013). Besides, they also help in improving water quality by grazing on phytoplankton and bacteria (Kumar et al., 2009).

Though the taxonomic composition of the crustacean communities of the lakes of Kashmir has been assessed several times in the last four decades, a thorough taxonomic categorization of the crustacean of the Wular Lake, a rural lake, designated a Ramsar Site of International Importance in Kashmir Himalaya, is yet to be achieved. Therefore, the objective of this work was to have a taxonomic assessment of the crustacean assemblages of Lake Wular.

MATERIALS AND METHODS

Study area

Geographically the lake is situated at an altitude of 1,580 m (a.m.s.l) between 34°16´-34°20´N latitudes and 74°33´-74°44´E longitudes. Wular Lake, an ox-bow type lake, is of fluviatile origin located in the North-West of Kashmir about 55 km from Srinagar City, formed by the meandering of River Jhelum, which is the main feeding channel besides other tributaries (Figure 1). The rural valley lake is drained in north-east by the only single outlet in the form of River Jhelum and plays a significant role in the hydrographical system of the Kashmir valley the by acting as a huge absorption basin for the annual flood waters.

The lake accounting for 60% of the fish production within the state of J&K and was included in 1986 as a wetland of national importance under the wetlands programme of the Ministry of environment and forests, Government of India. Subsequently in 1990 it was designated as a Wetland of International importance.
under the Ramsar Convention for management purposes. Catchment of the lake is comprised of sloping hills of the Zanskar ranges of the western Himalaya on the north eastern side and arable land around is used for agriculture purposes.

Sample collection and analysis

Crustacean samples for taxonomic analysis were collected on monthly basis at five study sites (Table 1). Hundred liters of subsurface lake water was filtered through Birge conical crustacean net having a mesh size of 75 µm. Preservation of the samples was carried out in 4% formalin to which four to five drops of glycerine and 5% sucrose were added. Various micro needles were used for dissecting the taxonomic parts (such as caudal ramous, 4th, 5th leg for copepods and the setae arrangement in the post abdominal claw for cladocerans). Identification of the crustaceans was done with the help of standard works of Pennak (1978), Battish (1992) and Edmondson (1992).

RESULTS AND DISCUSSION

During the entire study, a total of 42 taxa were reported, of which 22 species belonged to the order Cladocera represented by six families (Chydoridae, Daphniidae, Sididae, Bosminidae, Moinidae and Macrothricidae), 17 belonged to subclass Copepoda represented by three orders (Cyclopoida, Calanoida and Harpacticoida) and only three representative taxa comprised of order the Podocopida of class Ostracoda (Table 2). Among the Cladoceran, Chydoridae was the dominant family represented by four genera and nine species. Copepoda was dominated by the family Cyclopidae and was represented by six genera and thirteen species. Increase in number of Cyclopoidea species over Calanoidea effectively favours eutrophication (Patalas, 1972; Gannon and Stemberger, 1978; Straile and Geller, 1998; Anneville et al., 2007). However, Sendacz and Kubo (1984) associated the absence of Calanoidea copepods to eutrophic conditions in reservoirs of São Paulo State. Ostracoda represented by family Cyprididae was composed of two genera (Eucypris and Cypris).

The most dominant species reported from the entire lake were Chydorus sphaericus, Alona affinis, Macrothrix rosea among Cladocera, while species like Bryamptus minutus, Cyclops bicolor, Bryamptus nivalis and Diaptomus virginiensis were dominant representatives of Copepoda. Majority of the species exhibited wide occurrence throughout the lake while others showed a limited temporal and spatial distribution. Nevertheless, the number of crustacean species varied little between various selected biotopes.

Rich diversity and abundance of crustaceans in the lake is due to shallow nature of the lake associated with macrophytes that play an important role in the structure and dynamics of the microcrustacean assemblages (Scheffer et al., 2006), as macrophytes provides shelter and protection to these microscopic organisms against predators such as fish and macroinvertebrates (Scheffer, 1998), reduce predation and disturbances in the system (Cardinale et al., 1998), and favor an increase in the number of species due to high niche availability (Fahd et al., 2000; Cottenie et al., 2001; Cottenie and De Meester, 2003).

A characteristic seasonal pattern of species was observed that depends on the local conditions, environmental characteristics and quality of temporary aquatic systems in and around the aquatic systems throughout the study period (Williams, 1999; Fahd et al., 2000; Tavernini et al., 2008). Among Cladocerans genus Bosmina was eurythermal (having wide tolerance range to temperature) and as such showed different seasonal pattern in terms of population density. One of its species, Bosmina longirostris was abundant in winter, while the other species, Bosmina coregoni, was seen in summer. This replacement process may also be attributed to high-food availability dominated by large food particles as it is a summer plankton of eutrophic lakes (Gulati et al., 1991). Dominance of Chydoridae among cladocerans represent eutrophic condition of the lake (Gannon and Stemberger, 1978; Magadza, 1980). Further, dominance of small sized cladocerans over large bodied Cladocera is a clear sign of accelerated eutrophication (Pandit, 1980; Bays and Crisman, 1983; Sampaio et al., 2002). During the entire study, the low population density of large sized cladocerans like Daphnia sp., Moinodaphnia sp. and Diaphanosoma sp. were registered and may be ascribed to a shift mechanism for large bodied to smaller bodied organisms as a result of racing eutrophication (Pandit, 1980; Kaul and Pandit, 1982; Pandit, 1988;

Kingdom, Animalia; Phylum, Arthropoda; Subphylum, Crustacea.

Sampaio et al., 2002).

Copepoda, in the present study showed long growth patterns, it may be due to high food availability in the form of phytoplankton (Santer and Lampert, 1995), besides temperature (Marcus, 1982) that modulates egg development (Dole-Olivier et al., 2000). As per literature available (Zago, 1976; Crisman, 1978; Frey, 1980; Pandit, 1980., Crisman et al., 1992; Haberman, 1998; Rossa et al., 2001) among the 42 species listed during the present study 14 species (Alona guttata, Bosmina coregoni, Bosmina longirostris, Chydorus ovalis, Chydorus sphaericus, Ceriodaphnia, Moina, Daphnia, Diaphanosoma, Macrothrix rosea, Cyclops vernalis, Eucyclops agilis and Cyclops bicuspidatus) prefer eutrophic lake water conditions, while only five species (Sida crystallina, Cyclops scutifer, Eucyclops sp., Megacyclops sp. and Diaptomus sp.) prefer oligotrophic conditions. The remaining species can thus be categorized as eurytrophic exhibiting wide ecological amplitude and tolerating a wide range of salt concentration.
Therefore, the dominance of eutrophic (14) and eurytrophic (23) over oligotrophic (5) species is an indication that the lake is still enjoying the infancy stage of eutrophication (E/O=7.4) as per Jarnefelt's Plankton Quotient System (Järnefelt, 1956, c.f. Pandit, 2002).

ACKNOWLEDGEMENTS

Thanks are due to the Director, Centre of Research for Development and Head, Environmental Science, University of Kashmir for providing necessary laboratory facilities.
