ABOUT JSPPR

The Journal of Stored Products and Postharvest Research (JSPPR) is published monthly (one volume per year) by Academic Journals.

The Journal of Stored Products and Postharvest Research (JSPPR) is an open access journal that provides rapid publication (monthly) of articles in all areas of the subject such as Biological control of rot-inducing fungi, Post harvest losses of rice from harvesting to milling, Genetic variability studies between released varieties of cassava, Seed borne pathogens on farmer-saved sorghum etc.

The Journal welcomes the submission of manuscripts that meet the general criteria of significance and scientific excellence. Papers will be published shortly after acceptance. All articles published in JSPPR are peer-reviewed.

Instructions for Author

Electronic submission of manuscripts is strongly encouraged, provided that the text, tables, and figures are included in a single Microsoft Word file (preferably in Arial font).

The cover letter should include the corresponding author's full address and telephone/fax numbers and should be in an e-mail message sent to the Editor, with the file, whose name should begin with the first author's surname, as an attachment.

Article Types
Three types of manuscripts may be submitted:

Regular articles: These should describe new and carefully confirmed findings, and experimental procedures should be given in sufficient detail for others to verify the work. The length of a full paper should be the minimum required to describe and interpret the work clearly.

Short Communications: A Short Communication is suitable for recording the results of complete small investigations or giving details of new models or hypotheses, innovative methods, techniques or apparatus. The style of main sections need not conform to that of full-length papers. Short communications are 2 to 4 printed pages (about 6 to 12 manuscript pages) in length.

Reviews: Submissions of reviews and perspectives covering topics of current interest are welcome and encouraged. Reviews should be concise and no longer than 4-6 printed pages (about 12 to 18 manuscript pages). Reviews are also peer-reviewed.

Review Process
All manuscripts are reviewed by an editor and members of the Editorial Board or qualified outside reviewers. Authors cannot nominate reviewers. Only reviewers randomly selected from our database with specialization in the subject area will be contacted to evaluate the manuscripts. The process will be blind review.

Decisions will be made as rapidly as possible, and the journal strives to return reviewers' comments to authors as fast as possible. The editorial board will re-review manuscripts that are accepted pending revision. It is the goal of the JPP to publish manuscripts within weeks after submission.

Regular articles
All portions of the manuscript must be typed double-spaced and all pages numbered starting from the title page.

The Title should be a brief phrase describing the contents of the paper. The Title Page should include the authors' full names and affiliations, the name of the corresponding author along with phone, fax and E-mail information. Present addresses of authors should appear as a footnote.

The Abstract should be informative and completely self-explanatory, briefly present the topic, state the scope of the experiments, indicate significant data, and point out major findings and conclusions. The Abstract should be 100 to 200 words in length. Complete sentences, active verbs, and the third person should be used, and the abstract should be written in the past tense. Standard nomenclature should be used and abbreviations should be avoided. No literature should be cited. Following the abstract, about 3 to 10 key words that will provide indexing references should be listed.

A list of non-standard Abbreviations should be added. In general, non-standard abbreviations should be used only when the full term is very long and used often. Each abbreviation should be spelled out and introduced in parentheses the first time it is used in the text. Only recommended SI units should be used. Authors should use the solidus presentation (mg/ml). Standard abbreviations (such as ATP and DNA) need not be defined.

The Introduction should provide a clear statement of the problem, the relevant literature on the subject, and the proposed approach or solution. It should be understandable to colleagues from a broad range of scientific disciplines.

Materials and methods should be complete enough to allow experiments to be reproduced. However, only truly new procedures should be described in detail; previously published procedures should be cited, and important modifications of published procedures should be mentioned briefly. Capitalize trade names and include the manufacturer's name and address. Subheadings should be used. Methods in general use need not be described in detail.

Results should be presented with clarity and precision. The results should be written in the past tense when describing findings in the authors' experiments. Previously published findings should be written in the present tense. Results should be explained, but largely without referring to the literature. Discussion, speculation and detailed interpretation of data should not be included in the Results but should be put into the Discussion section.
The Discussion should interpret the findings in view of the results obtained in this and in past studies on this topic. State the conclusions in a few sentences at the end of the paper. The Results and Discussion sections can include subheadings, and when appropriate, both sections can be combined.

The Acknowledgments of people, grants, funds, etc should be brief.

Tables should be kept to a minimum and be designed to be as simple as possible. Tables are to be typed double-spaced throughout, including headings and footnotes. Each table should be on a separate page, numbered consecutively in Arabic numerals and supplied with a heading and a legend. Tables should be self-explanatory without reference to the text. The details of the methods used in the experiments should preferably be described in the legend instead of in the text. The same data should not be presented in both table and graph form or repeated in the text.

Figure legends should be typed in numerical order on a separate sheet. Graphics should be prepared using applications capable of generating high resolution GIF, TIFF, JPEG or Powerpoint before pasting in the Microsoft Word manuscript file. Tables should be prepared in Microsoft Word. Use Arabic numerals to designate figures and upper case letters for their parts (Figure 1). Begin each legend with a title and include sufficient description so that the figure is understandable without reading the text of the manuscript. Information given in legends should not be repeated in the text.

References: In the text, a reference identified by means of an author’s name should be followed by the date of the reference in parentheses. When there are more than two authors, only the first author’s name should be mentioned, followed by ‘et al’. In the event that an author cited has had two or more works published during the same year, the reference, both in the text and in the reference list, should be identified by a lower case letter like ‘a’ and ‘b’ after the date to distinguish the works.

Examples:

Cole (2000), Steddy et al. (2003), (Kelebeni, 1983), (Bane and Jake, 1992), (Chege, 1998; Cohen, 1987a,b; Tristan, 1993,1995), (Kumasi et al., 2001)

References should be listed at the end of the paper in alphabetical order. Articles in preparation or articles submitted for publication, unpublished observations, personal communications, etc. should not be included in the reference list but should only be mentioned in the article text (e.g., A. Kingori, University of Nairobi, Kenya, personal communication). Journal names are abbreviated according to Chemical Abstracts. Authors are fully responsible for the accuracy of the references.

Examples:

Short Communications

Short Communications are limited to a maximum of two figures and one table. They should present a complete study that is more limited in scope than is found in full-length papers. The items of manuscript preparation listed above apply to Short Communications with the following differences:

(1) Abstracts are limited to 100 words; (2) instead of a separate Materials and Methods section, experimental procedures may be incorporated into Figure Legends and Table footnotes; (3) Results and Discussion should be combined into a single section.

Proofs and Reprints: Electronic proofs will be sent (e-mail attachment) to the corresponding author as a PDF file. Page proofs are considered to be the final version of the manuscript. With the exception of typographical or minor clerical errors, no changes will be made in the manuscript at the proof stage.
Fees and Charges: Authors are required to pay a $550 handling fee. Publication of an article in the Journal of Stored Products and Postharvest Research (JSPPR) is not contingent upon the author's ability to pay the charges. Neither is acceptance to pay the handling fee a guarantee that the paper will be accepted for publication. Authors may still request (in advance) that the editorial office waive some of the handling fee under special circumstances.

Copyright: © 2016, Academic Journals.
All rights Reserved. In accessing this journal, you agree that you will access the contents for your own personal use but not for any commercial use. Any use and or copies of this Journal in whole or in part must include the customary bibliographic citation, including author attribution, date and article title.

Submission of a manuscript implies: that the work described has not been published before (except in the form of an abstract or as part of a published lecture, or thesis) that it is not under consideration for publication elsewhere; that if and when the manuscript is accepted for publication, the authors agree to automatic transfer of the copyright to the publisher.

Received 10 August, 2015; Accepted 31 December, 2015

Cashew apple, a juicy fruit, rich in vitamins and minerals, is still a highly underutilized fruit in Nigeria. Cashew apple can be processed into a variety of products, such as juice, quash, syrups, jam, candy, wine alcohol, vinegar and dietary fiber. Although various research works have been carried out on cashew apple, and its nutritional qualities, a number of challenges may still be responsible for it's under utilization. There is a lack of knowledge and skills in the processing and post-harvest management of cashew apple and its products. This results in a large amount of wasted material from Cashew nut processors in Nigeria. Other challenges may include unavailability and affordability of cashew apple handling and processing technologies, and low level of cashew apple consumption as a result of its inherent astringent compounds. Constant training and retraining of processors, collaboration between cashew nut processors and cashew apple processors, mass production and affordability of such simple and adaptable technologies will go a long way in addressing these challenges.

Key words: Cashew apple, cashew utilization, challenges and prospects.

INTRODUCTION

Cashew (Anacardium occidentale L.) is a very popular and widely propagated tree in Nigeria. It is often propagated for the economic importance of the nut it produces as well as the “cashew apple” or pseudo-fruit which is actually a swollen stalk leading to the nut. Cashew trees are enjoyed for their fruit during its fruiting season and as a sun shed at off season. Its fruit consists of a nut and an apple which is attached to the stalk of its tree.

Cashew apple is juicy and rich in vitamins and minerals. According to Augustin (2001), the moisture content of cashew apple ranges from 85 to 89%, while its protein content was put at 0.2 and 0.1% for fat content, 11.6% carbohydrates and 0.9% crude fiber. Its mineral content was found to be 261 mg /100 g while vitamins such as thiamin - 0.02 mg/100 g, riboflavin- 0.5 mg/100 g, nicotinic acid - 0.4 mg/100 g and vitamin A - 39 IV were

also found to be present in cashew apple.
Cashew apple, a potentially useful nutritional source, is almost entirely wasted during current standard processing methods (Abdul and Peter, 2010). In Nigeria, much attention has been placed on cashew nut and cashew nut processing while very little attention is placed on its apple. Often times, cashew nut processors in Nigeria harvest fresh and ripe cashew fruit just for its nut, while the apple is left to rot away. However, cashew apple can be processed into a variety of products with high economic and nutritional value in Nigeria.

PRODUCTS FROM CASHEW APPLE

The cashew apple can be processed into a variety of products such as Juice, Quash, Syrup, Jam, Candy, Wine, Alcohol, Vinegar and Dietary fiber. Well-developed current technologies exist for the production of these preparations.

Cashew apple juice

Simple pressing of cashew apple can yield good quality juice. Extraction can be done by using cashew juice expeller, screw press, basket press or hydraulic press to maximize juice collection. The juice can be prepared by pressing, filtering using a muslin cloth and pasteurizing. The juice can be used neat or by blending with other fruit juices. From the Preliminary investigation carried out in the National Centre for Agricultural Mechanization (NCAM), Ilorin, Kwara State, 100% cashew apple juice from same fruit variety pasteurized at different temperatures and time resulted in slight differences in flavor and color. This is a good indicator of possible varieties of its juice. The cashew apple juice can be blended with lime juice, orange juice or pineapple juice at a ratio of 3 to 1 and served chilled.

Cashew apple syrup

Simple boiling of cashew apple juice above boiling point of water can yield good quality cashew syrup. 750 ml of cashew apple syrup can be prepared using 1 kg of cashew apple. The juice obtained from the cashew apple can be cooked under brisk stirring with or without any additive until it turns to syrup. Preliminary investigation carried out in the National Centre for Agricultural Mechanization (NCAM) shows that cashew juice can be prepared into syrup without any additive or osmotically active agents, and can stand ambient storage for over six months. Syrup produced during this preliminary investigation was stored under ambient condition; proximate composition and microbial load analysis showed that no significant difference has occurred for six months and stability tests are ongoing as at the time of this review. Cashew apple syrup usually has a sharp sweet taste and good aroma.

Alcohol from cashew apple

The cashew apple can also be used for alcohol production. The mean recovery of alcohol from cashew apple is reported to be about 1.5%. This underscores the huge economic potential of cashew apple that is currently being wasted. Neelakandan and Usharani (2009) produced alcohol from cashew apple juice using immobilized Saccharomyces cerevisiae yeast. Medicinal properties of cashew alcohol are reported by Augustin (2001).

Dietary fiber

Fibrous residue left after extraction of juice can be dried and used in foods as dietary fiber. After extraction of juice, the chaff can be soaked in water to remove the residual juice; it is then dried and milled into powder. Experimental trials are currently ongoing in the National Centre for Agricultural Mechanization (NCAM) aimed at blending dried cashew fiber with high calorie foods as a means of reducing diet calorie intake.

CHALLENGES AND PROSPECTS OF CASHEW APPLE UTILIZATION

Although a variety of research works have been carried out on cashew apple and its nutritional qualities despite its low level utilization, a number of challenges may still be responsible for its continued underutilization. There however, exist windows of opportunities that could enhance its product diversification, consumption and general acceptability.

Lack of knowledge and skill

Lack of knowledge and skills in the processing and management of cashew apple products is the major limiting factor in the utilization of cashew apple in Nigeria. There is a lack of awareness on cashew apple products, as such, rural dwellers and food processors know little about its potential uses and possible economic value.

Lack of knowledge on the post harvest handling and preservation of cashew apple to ensure all year round production could be another limiting factor for industrial food processors. Since cashew is a seasonal and highly perishable fruit, constant training and retraining of processors on its preservation techniques such as osmotic drying, freeze drying, and how best to process it
into viable economic products is necessary.

**Cashew apple consumption**

Cashew apple is generally not a much loved fruit in Nigeria. A variety of reasons such as its bleaching effect on white fabrics and its high acid and tannin content could be responsible for this. According to Suganya and Dharshini (2011), cashew fruit is not readily consumed in its raw state due to its high content of astringent compounds.

Its fragile and soft nature especially when ripe, with its high perishability could be another factor that affects its acceptability. However, with proper processing techniques, these challenges can be addressed. Various processing methods leading to a variety of cashew products have been reported by Tran et al. (2014), Suganya and Dharshini (2011) and Abdul and Peter (2010). There is a high market potential for cashew apple products in Nigeria if properly processed.

**Wastage by cashew nut processors**

Cashew apple is often considered waste material in cashew nut processing industries. Most cashew nut processors in Nigeria rarely engage in cashew apple processing; often times, the nuts are removed while the apples are wasted. This is a major challenge for domestic processors. However, collaboration between cashew nut processors and cashew apple processors can help address this challenge.

**Unavailability and affordability of cashew apple handling and processing technologies**

Various research works carried out on cashew apple have revealed its nutritional qualities, variety of products and high economic value, however, processing technologies and equipment for commercial production are not readily available. This clearly limits processing of cashew apple juice at a commercial scale, and only small scale and homemade production occurs. Mechanization of agricultural processes has been identified as the backbone for sustainable food sufficiency (Azogu, 2013). Any attempt at addressing the issues of food security in Nigeria must necessarily concentrate on efforts to make simple technologies available, and stimulate adoption of such technologies among our peasant farmers who remains the main driver of agricultural production. Such cashew apple technologies should begin with simple tools that will arrest the problem of damage and injury to the cashew apple during harvest. A real commitment to the utilization of the currently wasted cashew apple resource would also include large scale motorized temperature/pressure controlled juice extractors that will result in minimal process loss to large scale thermal processing pots and storage containers. Mass production and affordability of such simple and adaptable technologies will go a long way in addressing this issue.

**CONCLUSION**

Cashew apple can be processed into a variety of products, with high economic and nutritional value, to improve food security in Nigeria. Though cashew apple is not a much loved fruit in Nigeria, there are windows of opportunity that could be utilized to enhance product diversification, consumption and general acceptability. Public awareness can be increased through marketing campaigns targeted towards both rural dwellers and urban food processors highlighting the potential and possible economic value. Government agencies such as the National Centre for Agricultural Mechanization (NCAM) and other Agro-equipment manufacturers should make available simple processing technologies for commercial production, and encourage collaboration between cashew nut processors and cashew apple processors. These steps will go a long way in addressing the underutilization of cashew apple in Nigeria.

**Conflict of Interests**

The authors have not declared any conflict of interests.
