ABOUT AJPP

The African Journal of Pharmacy and Pharmacology (AJPP) is published weekly (one volume per year) by Academic Journals.

African Journal of Pharmacy and Pharmacology (AJPP) is an open access journal that provides rapid publication (weekly) of articles in all areas of Pharmaceutical Science such as Pharmaceutical Microbiology, Pharmaceutical Raw Material Science, Formulations, Molecular modeling, Health sector Reforms, Drug Delivery, Pharmacokinetics and Pharmacodynamics, Pharmacognosy, Social and Administrative Pharmacy, Pharmaceutics and Pharmaceutical Microbiology, Herbal Medicines research, Pharmaceutical Raw Materials development/utilization, Novel drug delivery systems, Polymer/Cosmetic Science, Food/Drug Interaction, Herbal drugs evaluation, Physical Pharmaceutics, Medication management, Cosmetic Science, Pharmaceuticals, Pharmacology, pharmaceutical research etc. The Journal welcomes the submission of manuscripts that meet the general criteria of significance and scientific excellence. Papers will be published shortly after acceptance. All articles published in AJPP are peer-reviewed.

**INTRODUCTION**

Plants have been exploited for their medicinal use since 1500 BC (Chopra and Doiphode, 2002). They serve as a

*Author(s) agree that this article remain permanently open access under the terms of the Creative Commons Attribution License 4.0 International License*
source of medicine and are used to treat and prevent several infections, diseases and other ailments. The use of plant medicines is widely accepted in the culture and traditions of indigenous Africans and other nationalities such as India, China and Sri Lanka (Calixto, 2005; Ayyanan and Ignacimuthu, 2011).

There have been several reports on the use of medicinal plants in Ghana for wound infections and other diseases; the use of Erythrophleum ivorense (A. Chev.) in treating wounds (Adu-Amoah et al., 2014) and the use of Myrianthus arboreus and Alchornea cordifolia for treating wounds and other infections in Ghana (Agyare et al., 2014). There have also been reports on the use of Hilleria latifolia as an antinociceptive agent (Woode and Abotsi, 2011). The analgesic and anti-inflammatory activities of Xylopia aethiopica have been reported (Woode et al., 2012) and Phyllanthus muellerianus has been reported to possess anti-inflammatory activities (Boakye et al., 2016).

Entamoeba histolytica and Giardia lamblia are parasitic protozoa that cause gastrointestinal disorders such as diarrhea and dysentery. Metronidazole, the first line drug for the treatment is reported to have unpleasant side-effects such as a metallic taste, headache and dry mouth, and to a lesser extent nausea, glossitis, urticaria, pruritus and dark colored urine. In addition, carcinogenic, teratogenic and embryogenic properties have been documented when metronidazole is administered (Upcroft et al., 1999; Upcroft and Upcroft, 2001).

Naegleria fowleri is a free-living amoeba that causes primary amoebic meningocencephalitis (PAM). PAM is mainly managed with amphotericin B which has a very narrow therapeutic index making it toxic for use. The toxicity and adverse effects associated with the drugs used for the treatment of these parasitic infections underscore the need for newer medicines that are safe and effective for treating infections caused by these parasites. In this light, some Ghanaian medicinal plants were selected and screened against these parasites. The plants investigated were selected due to their antimicrobial and anti-inflammatory properties, and their ethnopharmacological uses in Ghana.

### MATERIALS AND METHODS

#### Plant materials

Plants materials (Table 1) were obtained from the Faculty of Pharmacy and Pharmaceutical Sciences, Kwame Nkrumah University of Science and Technology (KNUST), Kumasi, Ghana. Xylopia acid and geraniin were isolated from X. aethiopica and Phyllanthus muellerianus, respectively. Marine algae were obtained from the beaches at Prampram, Sakumono, Osu and James Town in the Greater Accra region of Ghana. The plant samples were authenticated by Prof. Alex Asaase of the Department of Botany, University of Ghana, Legon, Ghana. Voucher specimens are kept at the Ghana Herbarium, University of Ghana, Legon, Ghana. The algae samples were authenticated by Mr. Emmanuel Klubi of the Department of Marine Science and Fisheries, University of Ghana, Legon, Ghana (Table 1).

#### Preparation of plant and algae materials

The extracts were prepared by cold maceration of 300 g of powdered dry plant material in stoppered flasks containing 700 mL of the respective solvent (acetone, ethyl acetate, pet ether and methanol (Sigma-Aldrich, MO, USA) for 1 week at room temperature (28°C). After filtration using Whatmann filter paper No. 1 (Whatmann, London, UK), the solvent was evaporated under reduced pressure in a rotary evaporator at 40°C until a solid mass was obtained. The percentage yield of the various extracts related to the dried powdered plant material was determined (Table 1). The different extracts were tightly sealed in glass vials and stored in the refrigerator at 4°C. Exhaustive successive extraction was performed on Erythrophleum ivorense bark and leaf to obtain acetone, ethyl acetate, pet ether and methanol fractions from the extracts. This was to obtain fractions of different polarities and find the most active fraction. This would also help in activity guided isolation of the active ingredient(s).

Source of compounds

Geraniin (96% w/w HPLC grade) was kindly provided by Prof. Dr. Andreas Hensel, Institute of Pharmaceutical Biology and Phytochemistry, University of Muenster, Muenster, Germany and had been isolated from the aqueous extract of the aerial parts of *P. muellerianus* and it was found to be the major compound (4.3% w/w, related to the dried plant material) (Agaye et al., 2011). Xylopic acid (95% w/w) was obtained from Prof. Dr. David Obiri Danso, Department of Pharmacology, Faculty of Pharmacy and Pharmaceutical Sciences, KNUST, Kumasi, Ghana. Xylopic acid (1.47% w/w, related to plant extract) was isolated from the fruits of *X. aethiopica* (Woode et al., 2012).

Test parasites

*N. fowleri* strain KUL, *E. histolytica* strain HM1:IMSS and *G. lamblia* WB strain used in all the experiments were maintained at the Center for Discovery and Innovation in Parasitic Diseases, Skaggs School of Pharmacy and Pharmaceutical Sciences, University of California, San Diego, USA (CDIPD, SSPPS, UCSD, USA). *E. histolytica* was maintained in TYI-S-33 medium (Diamond et al., 1978) supplemented with penicillin (100 U/mL), streptomycin (100 μg/mL) and 10% heat inactivated adult bovine serum (Sigma-Aldrich, MO, USA). *G. lamblia* trophozoites were cultured in TYI-S-33 modified medium supplemented with penicillin (100 U/mL), streptomycin (100 μg/mL) and 10% v/v heattreated fetal bovine serum. *N. fowleri* was maintained axenically in Nelson’s culture medium supplemented with 10% heat inactivated FBS and 1x penicillin (100 U/mL), streptomycin (100 μg/mL) in vented flasks.

Percentage inhibition = \[
\frac{\text{Mean of maximum signal reference control} - \text{Experimental value}}{\text{Mean of maximum signal reference control} - \text{Mean of minimum signal reference}} \times 100
\]

RESULTS AND DISCUSSION

For *E. histolytica*, only xylopic acid and geraniin were active with IC50 values of 4.80 (13.30 μM) and 34.71 μg/mL (36.44 μM), respectively (Table 2). Metronidazole, the positive control had an IC50 of 1.287 μM. All other extracts and fractions exhibited activity more than 100 μg/mL.

Extrants of *A. glaberrima*, *M. nobilis*, *M. angolensis*, *U. fasciata*, ethyl acetate fraction of the extract of *E. ivorense* bark and xylopic acid had IC50 values of 15.91, 44.25, 20.00, 35.86, 13.76 and 11.45 μg/mL, respectively, against *G. lamblia* (Table 2). The IC50 of the control metronidazole was 10.47 μM.

The extract of *A. glaberrima* and xylopic acid exhibited IC50 of 38.70 and 16.06 μg/mL (44.55 μM), respectively, against *N. fowleri* (Table 2). The IC50 of the reference drug amphotericin B was 0.2 μM. The IC50 of the extracts and fractions were calculated using the mean and standard deviations of the percentage inhibition. The IC50 signifies the amount or concentration of the extracts and fractions that kills 50% of the parasites. The lower the IC50, the more active the said extract or fraction and vice versa.

Several studies have been carried out over the years and it has been proven that plants and their isolates can be a source of anti-parasitic agents. Barbosa et al. (2007) also reported that epicatechin, a flavonoid isolated from the *Geranium mexicanum* exhibited potent activity against *G. lamblia* more than metronidazole which is widely used as the main therapy. From our results, it was observed that xylopic acid exhibited anti-parasitic activity against all the three parasites at concentrations of less than 50 μg/mL. All the parasites tested cause inflammatory conditions and xylopic acid has been shown to possess anti-inflammatory properties (Obiri et al., 2014). Terpenes are well known to be active against protozoan parasites (Phillipson and Wright, 1991). This could be the reason for the activity exhibited by xylopic acid. McGaw et al. (2000) reported that plant extracts and compounds containing tannins and alkaloids possess activity against diarrhea-causing parasites such as *G. lamblia* and *E. histolytica*.

*U. fasciata* and *A. glaberrima* (Jato, 2015), *E. ivorense* (Adu-Amoah et al., 2014) and *M. nobilis* (Mothana et al., 2009) contain alkaloids and tannins. These bioactive constituents could have been responsible for the activity exhibited by these extracts and fractions. For all these activities observed, it could be attributed to the nature of phytochemical constituents present in the extracts and fractions. Geraniin is known to have anti-inflammatory activity (Boakye et al., 2016) and this could be the reason.
for its activity against *E. histolytica*, which causes inflammatory conditions such as amoebic colitis (Stanley, 2003). Xylopic acid could be said to be more active against *E. histolytica* than *G. lamblia* and *N. fowleri* since the IC<sub>50</sub> values for the parasites increased in that order. Ethyl acetate fraction of bark extract of *E. ivorense* exhibited activity against *G. lamblia*, whereas the fractions from the leaf had no activity. The extracts from *A. glaberrima*, *M. nobilis*, *M. angolensis*, the bark of *E. ivorense* and *U. fasciata* exhibited some activity against at least one of the parasites and therefore could be said to possess anti-parasitic activity. The extracts from the plants: *H. latifolia*, *L. ovalifolia*, *P. muellerianus*, and the algae *H. dentata* and *S. vulgar*, exhibited no activity against any of the parasites. Geraniin, which is an isolate from the aqueous leaf extract of *P. muellerianus*, exhibited activity against *E. histolytica*. It is possible that in the aqueous extract, the amount of the geraniin was not enough to elicit an anti-parasitic effect.

**Conclusion**

Xylopic acid was active against *E. histolytica*, *G. lamblia* and *N. fowleri*. *A. glaberrima* exhibited activity against *N. fowleri* and *G. lamblia*. The ethyl acetate fraction of the methanol bark of *E. ivorense*, extracts of *M. angolensis*, *M. nobilis* and *U. fasciata* exhibited activity against *G. lamblia*.

**ACKNOWLEDGEMENTS**

The authors are grateful to the World Intellectual Property Organization - Re: Search (WIPO-Re:Search) for the fellowship to GKD, and to Thomas Bombelles, Head of Global Health in the Global Challenges Division of WIPO for his strong support for this project.

**CONFLICT OF INTERESTS**

The authors declare that there is no conflict of interest.
