ABOUT JMPR

The Journal of Medicinal Plant Research is published weekly (one volume per year) by Academic Journals.

The Journal of Medicinal Plants Research (JMPR) is an open access journal that provides rapid publication (weekly) of articles in all areas of Medicinal Plants research, Ethnopharmacology, Fitoterapia, Phytotherapy etc. The Journal welcomes the submission of manuscripts that meet the general criteria of significance and scientific excellence. Papers will be published shortly after acceptance. All articles published in JMPR are peer reviewed. Electronic submission of manuscripts is strongly encouraged, provided that the text, tables, and figures are included in a single Microsoft Word file (preferably in Arial font).

Garcinia cola also known as “bitter cola” (Guttiferae) is a plant with a wide usage of its parts for various medicinal purposes. The seeds are chewed as aphrodisiac and for the treatment of coughs, dysentery and liver inflammation. Morinda lucida (Rubiaceae) commonly called “great morinda” has been shown to have antimalarial and anti-pyretic activities. This study aimed at evaluating the anti-infective and antioxidant properties of G. cola and M. lucida and to justify their folkloric uses. Ethanol extracts of the stem barks of G. cola (GCB) and M. lucida (MLB) were evaluated for their antimicrobial, anthelmintic and antioxidant activities. Antimicrobial activity was evaluated by determining the minimum inhibitory concentrations (MIC) using the micro broth dilution method against strains of Staphylococcus aureus, Streptococcus pyogenes, Escherichia coli, Pseudomonas aeruginosa, Salmonella typhi and Candida albicans. Anthelmintic activity was evaluated by determining the effects of the extracts on the paralytic and death times of Pheretima posthuma at concentrations of 50, 20 and 10 mg/mL using piperazine citrate (PZN) (15 mg/mL) and albendazole (ABZ) (20 mg/mL) as references. Antioxidant activity was determined by 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging activity using ascorbic acid (ASA) as reference standard. The results reveal that the extracts from both plants demonstrated antimicrobial activity with MIC values ranging from 50 to 80 mg/mL and 10 to 30 mg/mL for GCB and MLB, respectively. Both extracts also demonstrated a concentration dependent anthelmintic activity with decrease in paralytic and death times upon an increase in extract concentrations. GCB and MLB extract showed antioxidant activities with IC₅₀ values, 6.830 and 342.1 µg/mL, respectively. Phytochemical screening of both extracts revealed the presence of tannins, glycosides, alkaloids and flavonoids. These findings may justify the folkloric uses of these plants.

Key words: Garcinia cola, antioxidant, Morinda lucida, antimicrobial, anthelmintic.

INTRODUCTION

The use of medicinal plants to manage various ailments affecting humans have been in existence since ancient times. Studies have shown that in Africa, about 80% of the population rely on medicinal plants for the...
management of various ailments (Agyare et al., 2009). It is therefore important that such plants should be investigated to better understand their properties, safety and efficacy.

Morinda is a genus of flowering plants of the family, Rubiaceae (Umberto, 2000). In Ghana, the plant is used in managing ailments such as diabetes, hypertension, cerebral congestion, dysentery, stomach-ache, leprosy and gonorrhoea. Traditionally, the stems are used to treat piles while the leaves are used to treat fever (CSIR-FORIG, Ghana, 2017). Extracts of the plant have shown anti-inflammatory, febrifuge and pain reducing activity as well as antimalarial activity (Dalziel, 1973; Awe and Makinde, 1998). Methanol and ethanol extracts of the leaves of Morinda lucida have also been shown to possess antidiabetic activity (Bailey and Day, 1989). The leaves of the plant have also demonstrated trypanocidal activity (Asuzu and Chineme, 1990).

Garcinia cola (Guttiferae) is a multipurpose tree crop with increased value for the medicinal use of its parts. It is known as a wonder plant since every part of it has a medicinal importance. The seeds are chewed as an aphrodisiac or used to cure cough, dysentery, or chest colds in herbal medicine (Irvine, 1961). The latex or the gum is used internally against gonorrhoea and applied externally on fresh wounds (Iwu, 1989). The sap is used in curing parasitic diseases. The stem is used to produce bitter chewing sticks which is chewed chiefly as a masticatory to set an action of nervous alertness and has also been proven to exhibit pharmaceutical uses in treating coughs and throat infections (Farombi et al., 2005). G. cola serves as a source of raw material in the pharmaceutical industry; the raw stem bark can be used as a purgative, the powdered bark applied on malignant tumours (Iwu, 1989). G. cola exhibits purgative, antiparasitic, anti-inflammatory, antibacterial and antiviral properties (Ogunmoyole et al., 2012). biflavonoid isolates, kolaviron, extracted from G. cola seeds were tested on streptozotocin (STZ)-diabetic rats. This study confirmed that cardiac, renal and hepatic function indices were significantly elevated during STZ-induced diabetes and that oral administration of kolaviron reduced the levels of some of the indices. Therefore, kolaviron may offer protection for tissues of animals during diabetes (Adaramoye, 2012). G. cola seeds have been reported to have an anti-inflammatory activity (Olaleyeye et al., 2000).

Although a lot of work has been done on the other parts of these plants, very little research has been conducted on the stem bark of these plants. This study therefore aims at evaluating the anti-infective and antioxidant properties of these plants and to justify or otherwise their folkloric uses.

**METHODS**

**Plant collection**

The stem bark of G. cola was obtained from the Forest Research Institute in Kumasi, Ghana while that of M. lucida was obtained from the physique garden of the Faculty of Pharmacy and Pharmaceutical Science, Kwame Nkrumah University of Science and Technology (KNUST), Kumasi, Ghana. Both samples were authenticated at the Department of Pharmacognosy, KNUST. The samples were sun dried for two weeks, cut into pieces and ground into powder using laboratory milling machine.

**Extraction of plant material**

A quantity of 200 g of the powder of each sample obtained was weighed and cold macerated using 1.0 L of 70 %v/v for 72 h. The bottles and their contents were placed on a Stuart mini orbital shaker and subjected to vigorous shaking hourly for 3 h. The supernatant solution obtained from each extract after 72 h was decanted into a clean beaker and filtered using a filter paper with the aid of a suction pump. The filtrates were then concentrated using a rotary evaporator (Buchi, Germany) at 40°C to obtain the crude extracts. The extracts obtained were then dried at 40°C in an oven until dry powdered extracts were obtained. The dried extracts were then kept in a desiccator until needed.

**Phytochemical analysis**

The presence of some secondary plant metabolites such as tannins, alkaloids, glycosides and flavonoids were tested using the dried crude extracts (TrEase and Evans, 2002).

**DPPH free radical scavenging activity**

The free radical scavenging activity of the extracts were determined according to the method described by Agyare et al. (2015) using 1,1-diphenyl-2-picryl-hydrazyl (DPPH). MLB extract solutions of concentration 500, 1000, 1500 and 2500 µg/mL and GCB extract solutions of concentrations 1, 10, 30, 300 and 1000 µg/mL were prepared in test tubes with methanol. Solutions of the reference antioxidant (ascorbic acid) of concentrations 3.125, 6.25, 12.5, 25, 50 and 100 µg/mL were prepared in methanol. DPPH solution of concentration 0.002%w/w was also prepared in methanol in a dark room. Three millilitres of DPPH solution was added to 1.0 mL of each concentration of extract and reference antioxidant. The test tubes were then kept in the dark for 30 min after which the absorbance (Aₒ) of excess DPPH in both extracts and standard solutions were measured at 517 nm using a UV spectrophotometer (Jenway, USA). The absorbance (Aₑ) for a blank solution containing equal volumes of methanol and DPPH was also read and served as a control. The percentage of free radicals scavenged was calculated using the equation:

\[
\text{% inhibition} = \left(\frac{Aₒ - Aₑ}{Aₒ}\right) \times 100
\]

Inhibitory concentration (IC₅₀) was determined as the concentration of samples which scavenged 50% of free DPPH radicals.

**Evaluation of antimicrobial activity**

**Test organisms**

Clinical strains of Staphylococcus aureus and Streptococcus pyogenes, Escherichia coli, Pseudomonas aeruginosa, Salmonella typhi and Candida albicans were used for the studies. The organisms were obtained from the microbiology Department of Korle Bu Teaching Hospital, Accra, Ghana. The organisms were cultured in nutrient broth at 37°C for 24 h prior to the experiment.
The turbidity of the actively growing broth cultures was adjusted with sterile distilled water to obtain a turbidity optically comparable to that of 0.5 McFarland Standard.

**Micro-dilution assay**

The minimum inhibitory concentration (MIC) was determined by the micro broth dilution method using 96 well microtitre plates (Eloff, 1998). A quantity of 50 µL of the double strength nutrient broth was used to fill each well. A volume of 5 µL of 24 h organism suspension was added as well as calculated volumes of the extracts, standard drugs (Ketoconazole and Ciprofloxacin), and sterile water to give a final well volume of 100 µL with varying extract and standard concentrations per well. The concentrations of extracts prepared ranged from 100 to 20 µg/mL. The microtitre plates were covered and incubated at 37°C for 24 h. A volume of 20 µL MTT (3-(4,5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide) solution was added to the wells. The MIC was determined as the lowest concentration that inhibited the growth of the organisms which was indicated by the absence of purple coloration upon addition of the MTT solution.

**Evaluation of anthelmintic activity**

**Collection of worms**

Adult Indian earthworms were collected from the soil in a water logged area in Tema Community 10 and cabbage farms at Miotso near Central University, Ghana. The earthworms of length approximately 7 to 12 cm and width, 0.2 to 0.6 cm were used for the experiment due to their anatomical and physiological resemblance to human intestinal roundworm parasites and also because of easy availability; they are used extensively for the preliminary in vitro evaluation of anthelmintic compounds (Tiwari et al., 2011). The earthworms were washed with distilled water to rid them of debris.

**Anthelmintic bio-assay**

The worms were divided into eight groups each comprising of four earthworms. Ten millilitres of each extract solution of concentrations 10, 20 and 50 and mg/mL were prepared for both GBC and MLB using distilled water. Concentrations of 20 mg/mL albendazole and 15 mg/mL piperazine citrate were used as reference standards. All the samples and the standard drugs were freshly prepared before commencement of the experiments. The washed earthworms were placed in Petri dishes containing 10 mL of the respective formulations and concentrations. Observations were made for the time taken for paralysis and death of individual worms. Paralysis was noted when the worms ceased to move but were revived when shaken or placed in warm water at 50°C. Death was noted when the worms lost motility coupled with a fading away of their body colour. Normal saline was used as a negative control and the respective death and paralysis times were recorded (Bhawar et al., 2009).

**Statistical analysis**

All results and graphs were plotted and analysed using the Graph Pad Prism 5.0 for windows (Graph Pad software, San Diego, CA, USA).

**RESULTS**

**Phytochemical screening**

The phytochemical screening revealed the presence of glycosides, saponins, alkaloids, tannins and flavonoids in the extracts of MLB and GCB.

**Antimicrobial activity**

GCB and MLB extracts both demonstrated broad spectrum antibacterial and antifungal activity against the selected microorganisms. The antimicrobial activity was more profound in MLB as indicated in Table 1.

**Antioxidant activity (free radical scavenging activity)**

The antioxidant activity of GCB was highly profound as indicated in the IC$_{50}$ value obtained (Table 2, Figure 1). MLB however showed poor antioxidant activity. The lower the IC$_{50}$ value the more potent the antioxidant activity.

**Anthelmintic activity**

Both extracts demonstrated a concentration dependent anthelmintic activity as shown in Table 3.

---

DISCUSSION

Phytochemical analysis of the extracts of both plants revealed the presence of tannins, saponin glycosides, anthraquinones, cardiac glycosides, alkaloids and flavonoids. Natural antioxidants are mainly obtained from plants rich in phenolic compounds such as flavonoids, phenolic acids and tocopherol (Ali et al., 2008). Phenolic compounds possess biological properties such as anti-apoptosis, anti-aging, anti-carcinogen, anti-inflammation,
anti-atherosclerosis, cardiovascular protection and improvement of endothelial function as well as inhibition of angiogenesis and cell proliferation activities (Han et al., 2007). Flavonoids have also been found to have antimicrobial activity against a wide array of microorganisms (Pistelli and Giogi, 2012; Cushnie and Lamb, 2005).

The stem bark extract of *M. lucida* serves as a reservoir of bioactive phytochemical compounds. The results as shown previously confirm other studies conducted on this plant part (Fasola and Ogunyomi, 2005; Adomi and Umukoro, 2010). The *M. lucida* extract showed broad spectrum antibacterial activity as well as antifungal activity against selected microbes. The antimicrobial activity could be attributed to flavonoids and tannins present in the extracts (Gomes de Melo et al., 2010). The antioxidant activity exhibited could be attributed to the phenolic compounds in the plant (Kahkonen et al., 1999).

Various research works have been done on different parts of *G. cola* including the seeds, fruits, roots and leaves. However, very little research has been conducted on the stem bark of the plant. The stem bark extract demonstrated broad spectrum antibacterial activity as well as antifungal activity which could be attributed to the secondary metabolites as stated previously. Studies conducted by Ogunmoyole et al. (2012) on the seeds and fruit extract respectively have shown antioxidant activity. The stem bark extracts as used in this experiment also demonstrated antioxidant activity with IC$_{50}$ value (6.830 µg/mL) almost comparable to that of ascorbic acid (2.929 µg/mL).

This gives an indication of the possible high level of phenolic compounds present in the stem bark hence the high antioxidant activity. *G. cola* bark extracts also demonstrated a concentration dependent anthelmintic activity with higher concentrations demonstrating better anthelmintic activity. Studies have largely attributed the anthelmintic activities of plants to the presence of tannins. Tannins are believed to interfere with the energy generation of the helminth parasite by uncoupling oxidative phosphorylation or by binding to free proteins in the gastrointestinal tract of the helminth. This eventually results in death of the parasite (Adu et al., 2015; Olusegun-Joseph et al., 2012).

**Conclusion**

Stem bark ethanol extracts of *M. lucida* and *G. cola* possess broad spectrum antibacterial and antifungal activity. Both extracts also possess antioxidant and concentration dependent anthelmintic activities. This could justify their use in folkloric medicine for the management of various ailments.

**CONFLICT OF INTERESTS**

The authors have not declared any conflict of interests.

**Chemical composition of the essential oil of *Viola serpens* from Bageshwar (Shama), Uttarakhad, India**

Deepak Chandra¹, Gunjan Kohli², Kundan Prasad², G. Bisht², Vinay Deep Punetha² and H. K. Pandey²

¹Department of Chemistry, D.S.B. Campus Nainital 263002, Uttarakhand India.
²Defence Institute of Bio-Energy Research (DIBER) Pithoragarh, Uttarakhand-262501, India.

Received 22 June, 2015; Accepted 27 August, 2015

The families Violaceae (alternatively known as Alsodeiace or Leoniaceae or Retrosepalaceae) comprise twenty genera and about 800 species. *Viola serpens* belongs to family Violaceae and commonly known as “Banafsa”. It is a small glabrous, perennial herb, which is found throughout India in moist woods and hilly districts. The essential oil of aerial parts of *V. serpens*, were extracted by steam distillation. The quantitative and qualitative analysis of volatile essential oil constituents of the plant was done by Gas Chromatography (GC) and GC-Mass Spectrometry. A total of 50 components of the essential oil of *V. serpens* were identified, accounting for 81.38% of the total oil. The main compounds found were Bis (2-ethylhexyl) maleate (15.62%), 2, 4, 4, 6-Tetramethyl-2-heptene (11.52%), Hexen-3-ol (6.56%), and Cis Verbeno (1 4.77%). The chemical constituents in the essential oil from *V. serpens* were identified in the following classes or groups of chemical compounds, such as monoterpenes, sesquiterpenes volatile organic compounds and their oxygenated hydrocarbons. Therefore, the essential constituents could be used as antioxidant, antifungal or antimicrobial agent in new drugs preparation for therapy of infectious diseases.

**Key words:** *Viola serpens*, essential oil, gas chromatography, mass spectrometry.

**INTRODUCTION**

Mother earth has gifted the mankind with lots of plants which has the ability for curing the health disorders of human being. These feature has been identified in the pre-historic times (Balakumbahan et al., 2010), and the world wide use of herbal therapies and health care preparations that are prescribed in ancient books like vedas and the bibles pave way for the discovering of natural products with medicinal values (Bhuvaneswari and Balasundaram, 2009). 80% of the world’s population meets their primary health care through traditional medicines, as estimated by WHO. Medicinal plants possess secondary metabolites which are the main sources of medicinal drugs having curative nature. 7500 species are being used as medicinal plants in India (Balakumbahan et al., 2010). *Viola serpens* Wall belongs to family Violaceae and commonly known as “Banafsha”.

It is a small glabrous, perennial herb, which is found throughout India in moist woods and hilly districts. It is also found in China, Java, Ceylon, Philippines, and Thailand up to an altitude of 2000 m in India. It is distributed in the Himalayan region, hills of Meghalaya, Nagaland, and Manipur (Bal, 1932; Dhar and Kachroo, 1983). It is also found in Ganjam Hills of Orissa, Himachal Pradesh, Uttarakhand, Karnataka and Tamilnadu (Chawdhary and Wadhwa, 1984). The whole plant is medicinally useful. It is aperients, antiseptic, antipyretic, cooling, demulcent, diaphoretic, diuretic, emetic, emollient, expectorant, febrifuge, and purgative in action. It is one of the most useful medicinal plants and used as antipyretic, demulcent, diaphoretic and diuretic drug. It is useful in asthma, bleeding piles, cancer of the throat, constipation, cough, fever, skin diseases and headache (Kumar and Digvijay, 2014). Some workers reported glycoside methyl salicylate, quercitrin, alkaloid, volatile gum, mucilage, sugar and saponin, saponins, tannins, amino acids, terpenoids, reducing sugars, glycosides, and flavonoids were isolated form whole plants of V. serpens.

MATERIALS AND METHODS

Plant material

The plant V. serpens was collected in the month of October, 2013 from Shama (Kapkote) 52 km away from Bageshwar, Uttarakhand, India. The plant was authenticated by Botanical Survey of India (BSI), Dehradun. A voucher specimen (No.114835) was deposited in the Herbarium Section at BSI, Dehradun, India.

Essential oil extraction

The fresh aerial parts of V. serpens (5 kg) were chopped and steam-distilled using copper still fitted with spiral glass condensers. The distillate was saturated with NaCl and extracted with n-hexane. Anhydrous Na2SO4 was then added to dry the organic phase which was separated using separating funnel and finally the solvent was evaporated under reduced pressure. The percentage content of the oil was calculated on the basis of dry weight of plant material. The oil was then stored in screw-capped vials, under refrigeration until needed.

Gas chromatographic analysis (GC)

The oil was analyzed by using a Shimadzu 2010 (Phenomenex, Inc., Torrance CA, USA) auto system GC. The column temperature was programmed at 80°C (holding time for 2 min) to 210°C (holding time 5 min) at 3°C min⁻¹ and then 210 to 300°C at 20°C min⁻¹ with final hold time of 15 min, using N2 at 30.0 ml/min column head pressure as carrier gas, the injector temperature was 270°C and detector (FID, Flame ionization detector) temperature 280°C.

GC-MS analysis and identification

The GC-MS used was Autosystem 2010 GC (Rtx- 5, 30 m × 0.25 mm, I.D. FID 0.25 µm) coupled with Shimadzu QP 2010 plus with thermal desorption system TD 20 with (Rtx-5) fused silica capillary column (30 m × 0.25 mm with film thickness 0.25 µm). The column temperature was 80°C (holding time for 2 min) to 210°C (holding time 5 min) at 3°C min⁻¹ and then 210 to 300°C at 20°C min⁻¹ with final hold time of 21 min, using helium as carrier gas. The injector temperature was 230°C and 0.2 µl in n-hexane, with split ratio of 1:30 MS were taken at 70 eV with a mass range of 40 to 650 amu.

Identification of the compounds

Identification of constituents were done on the basis of Retention Index (RI, determined with reference to homologous series of n-alkanes Cn-C18, under identical experimental condition), MS library search (NIST and WILEY), and by comparison with MS literature data (Adams, 2007). The relative amounts of individual components were calculated based on GC peak area (FID response) without using correction factor. Retention indices (RI) were determined with reference to a homologous series of normal alkanes, by using the following formula (Kovats, 1958).

\[ KI = 100 \times \frac{\log t^f_R (\text{unknown}) - \log t^f_R (C_n)}{\log t^f_R (CN) - \log t^f_R (C_n)} \]

where \( t^f_R \) is the net retention time (t₀ − t₁); \( t₀ \) is the retention time of solvent (dead time); \( t₁ \) is the retention time of the compound; \( C_n \) is number of carbons in longer chain of alkane; \( C_n \) is number of carbons in shorter chain of alkane; \( n \) is the number of carbon atoms in the smaller alkane; \( N \) is the number of carbon atoms in the larger alkane.

RESULTS AND DISCUSSION

The GC and GC-MS analysis of leaf oil of V. serpens resulted in the identification of 50 constituents in Table 1. The identified constituents of the oil are listed in Table in the order of their elution in Rtx-5 column. The main compounds found were Bis(2-ethylhexyl) maleate 15.62%, 2,4,4,6-Tetramethyl-2-heptene 11.52%, Hexen-3-ol 6.56%, and Cis Verbenol 4.77% (Figure 1). The minor chemical constituents were found to be Phytol acetate 0.08%, Tetracosane 0.16%, Germacrene B 0.21%, Ethyl Lactate 0.22%.

Essential oils are found in various parts of the plants, such as leaf, flower, root and are stored in special oil cells and gates. The essential oils extracted from plants are indispensable materials in the pharmaceutical, food, and cosmetics sectors, because of the increasing concern with harmful synthetic additives (Sacchetti et al., 2005). A great majority of the essential oils are used as fragrance in perfumes and aromas in food industry. The essential oils have a number of biological activities, including antibacterial, antifungal and antioxidant properties (Fatouma et al., 2011 and Jihua et al., 2011).

Essential oils constitute a major group of agro-based industrial products and they find applications in various types of industries, such as food products, drinks, perfumes, pharmaceuticals and cosmetics (Anwar et al., 2009a, b; Burt, 2004; Celiktas et al., 2007; Hammer et al., 2008; Hay and Svoboda, 1993; Hussain et al., 2008;

*a*=Retention index (RI), b=MS (GC-MS).
Teixeira da Silva, 2004). The compounds from the plant based essential oil are useful as an alternative therapy, either directly or as models for new synthetic products (Houghton, 2000). Aromatherapy is the therapeutic use of fragrances or at least mere volatiles to cure diseases, infections and indispositions by means of inhalation (Buchbauer, 2000; Buchbauer et al., 1993). This has recently attracted the attention of many scientists and encouraged them to screen plants to study the biological activities of their oils from chemical and pharmacological investigations to therapeutic aspects. Hopefully, this will lead to new information on plant applications and new perspective on the potential use of these natural products.

CONFLICT OF INTERESTS

The authors have not declared any conflict of interests.

ACKNOWLEDGEMENTS

The authors are grateful to AIRF, Jawaharlal Nehru University, New Delhi for the G.C coupled with Mass Spectrometry (GC-MS), and G.C with FID analysis facilities.
