Uterotonic effect of aqueous extract of Launaea taraxacifolia Willd on rat isolated uterine horns

Adebisi Mobolawa Iyabo* and Alka Hauwa

Department of Pharmacology and Toxicology, Faculty of Pharmaceutical Science, Usmanu Danfodiyo University, Sokoto, Nigeria.

Received 24 August 2018; Accepted 29 October, 2018

Launaea taraxacifolia is used by the traditional health practitioners in Sokoto to ease labour pains and augment labour thereby facilitating child birth. This study examined the effect of the aqueous extract of the whole plant on isolated uterus from non-pregnant rats pre-treated with stilbestrol and from pregnant rats in late gestation. This was compared to the effects of uterine contraction agonists, namely; oxytocin, histamine and acetylcholine. The possible mechanism of uterotonic activity was investigated using antagonists such as piroxicam, mepyramine and atropine. The aqueous extract of L. taraxacifolia produced a dose-dependent uterotonic activity. In the stilbestrol treated non-pregnant uterus, the force generated at 400, 800 and 1600 mg/ml was 1.469, 1.624 and 1.793 times greater than the control, respectively. In the pregnant rat uterus, a dose of 400, 800 and 1600 mg/ml generated a force of contraction that was 1.36, 1.51 and 1.66 times greater than the control, respectively. When the relative potency was compared to oxytocin, the gold standard uterotonic, L. taraxacifolia at 1600 mg/ml was found to be 0.08 times more potent than 0.4 µg/ml oxytocin in the stilbestrol treated non-pregnant rat uterus. In the pregnant rat uterine strip however, oxytocin was 0.17 times more potent than 1600 mg/ml L. taraxacifolia. Pre-treating the tissue with either atropine or mepyramine before administering the extract showed an inhibitory effect while piroxicam completely abolished its uterotonic effect, showing a probable moderate stimulation of muscarinic and histamine receptors but majorly the oxytocin receptors by L. taraxacifolia. A preliminary phytochemical screening of the extract shows the presence of saponins, tannins, flavonoids and steroids. A dose of 2000 mg/kg/oral of L. taraxacifolia was found to be well tolerated in rats with no sign of toxicity. Thus, L. taraxacifolia contains phytochemicals with uterotonic properties thereby justifying its ethnobotanical use in easing labour.

Key words: Launaea taraxacifolia, uterotonic, labour, isolated uterus.

INTRODUCTION

Since time immemorial, plants have been used for their effects upon sex hormones particularly for suppressing fertility, regularizing menstrual cycle, relieving dysmenorrheal, treating enlarged prostrate, menopausal symptoms, breast pain and during and after childhood (Williamson et al., 1996). This is of importance especially in developing countries where modern medicine and health care is both inaccessible and unaffordable hence more than 80% of the populace continues to rely on traditional form of medicine (WHO, 2003). This form of medicine is

also used in solving female reproductive health issues. Uterotonic plants are plants that stimulate uterine contraction and are therefore used to assist labour, remove retained placenta, control post partum bleeding and as an abortifacient (Watcho et al., 2010). They are also of importance in facilitating uterine contraction following a miscarriage to reduce hemorrhage (Roqaiya et al., 2015). Various plants have been used to regulate a number of issues relating to pregnancy and delivery as well as post-partum complications. Examples of such plants are Monechma ciliatum (Uguru et al., 1998), Musanga cecropioides (Aydya et al., 2006), Harpagophyllum procumbens (Mahomed and Oyewole, 2006), Ficus asperifolia (Watcho et al., 2011), Ananas comosus (Monji et al., 2016), unripe fruits of Carica papaya (Praveena et al., 2017) and Steganotaenia Araliaceae (Goma et al., 2017); all of which are used to ease the birthing process due to their uterotropic and oxytocic properties; plants such as Ricinus communis (Raj et al., 2006), Strychnos potatorum (Shah et al., 2009) and Macrotyloma axillare (Odhambo et al., 2017) have been reported to have contraceptive property, while Lawsonia inermis (Mudi et al., 2011), Bamusa vulgaris (Yakubu et al., 2009) and Millettia aboensis (Onyegeme-Okeny et al., 2016) possess abortifacient properties. In a review of herbs with uterotropic property, Roqaiya et al., (2015) reported 16 plants species whose uterotropic property have been validated in both in vivo and in vitro models.

Launaea taraxacifolia common names wild lettuce or African lettuce and locally known as Noomen barewa in Hausa or Yanrin in Yoruba is one of the plants that are claimed by the locals to ease birthing process and alleviate labour pains and it is therefore used for that purpose. It grows as a weed along road sides and in bushes in many African countries. It is a perennial herb up to 150 cm tall, with creeping root system. Its stem is erect, often woody at the base (Adebisi, 2004). In Nigeria, the plant is found in the far north (Sokoto, Kebbi and Zamfara States) as well as among the Yoruba speaking states in the south. In Nigeria, the plant is fed to nursing livestock to induce multiple birth. In Benin, it is used as a febrifuge while in Ghana; the leaves are rubbed on the limbs of backward children to induce them to walk (Burkill, 1997). It is sometime burnt for its ash which is used as vegetable salt (Adebisi, 2004). It has also been reported as antimicrobial as it is established to have activity against Escherichia coli and Pseudomonas aeruginosa (Gbadamosi et al., 2012). L. taraxacifolia provides protection against cisplatin-induced hepatorenal damage through its antioxidant activities (Adejuwon et al., 2014). A review of ethnopharmacological and nutraceutical relevance of L. taraxacifolia documented effects such as antidiabetic, antihypertensive, anticancer, antimalarial, antibacterial and antiarthritic properties (Adinortey et al., 2018). Aboderin et al. (2017) however reported some degree of toxic effects on the liver and kidney of albino rats treated with aqueous of L. taraxacifolia and emphasized the need for caution in its use for medicinal purposes. The aim of this study was to investigate the uterotonic property of this plant and the possible mechanism of action in order to validate its ethnobotanical use. This study could provide a useful guide to the discovery of lead compounds with oxytocic properties which can be of great benefit in the management of aforementioned gynecological conditions.

MATERIALS AND METHODS

Plant material

The whole plant of L. taraxacifolia was collected fresh from the wild in Talata Mafara area of Zamfara State. The plant was identified and authenticated at the herbarium of Department of Biological Sciences, Usmanu Danfodiyo University, Sokoto where an herbarium specimen with voucher number UDUH/ANS/0010 was deposited.

Experimental animals

Healthy female rats weighing between 130-150 g were obtained from the animal house of the Department of Pharmacology and Toxicology, Usmanu Danfodiyo University, Sokoto. The animals were kept under standard environmental conditions with access to feed and water ad libitum. The animals were divided into two categories.

Drugs and chemicals

The following drugs were purchased from Sigma Chemical (St Louis, MO, USA): oxytocin, histamine, mepymarine, acetylcholine hydrochloride, stilbestrol; while piroxicam and atropine were purchased from a local pharmacy. All other chemicals used were of analytical grades.

Preparation of extract

The whole plant was dried under shade to constant weight and ground manually using mortar and pestle. Forty gram (40 g) of the powdered plant material was extracted by maceration using distilled water. It was evaporated to dryness over water bath at 50°C and the percentage yield was calculated.

Oestrogen-dominated non-pregnant rats

All the animals in this category were pretreated with stilbestrol (0.1 mg/kg subcutaneous) for 24 h prior to use in order to induce oestrus phase. Vaginal smears were taken immediately before the animals were sacrificed in order to ascertain that the animals were in oestrus phase. Female rats in oestrus were used for the study.

Pregnant rats

Female animals were mated with male overnight. The morning after mating occurred, each female was examined for the presence of a vaginal plug or a vaginal swab was taken to detect any sperm under light microscopy. The presence of a vaginal plug or sperm
positivity was designated as day 0 of gestation. Pregnant animals were housed two per cage with access to water and feed *ad libitum*. They were kept till late pregnancy (Day 16 to 20) before use.

**Preliminary phytochemical analyses**

**Acute oral toxicity**

The acute oral toxicity study was done using the "Up and Down method" in healthy adult female albino rats according to OECD guidelines No. 425 (OECD, 2008). A limit dose of 2000 mg/kg was used for the study. Five female rats were labeled for identification. An animal was picked at a time, weighed and dosed with equivalent volume of extract containing 2000 mg/kg body weight dissolved in distilled water as a vehicle after overnight fasting. Oral administration of drug was done using gastric feeding tube. Each animal was observed after dosing for the first 5 min for signs of regurgitation and then kept in a metallic cage. Each was then observed every 15 min in the first 4 h after dosing, every 30 min for 6 h and daily for 48 h for the short-term outcome according to the specifications of the OECD. The animals were monitored for a total of 14 days for the long-term possible lethal outcome.

**Experimental design**

Each of the pregnant and stilbestrol-pretreated non-pregnant female rats were anaesthetized using chloroform. The uteri were promptly removed, cleaned of the connective tissues and cut into strips of about 1 cm length. Each uterine strip was mounted in an organ bath of 25-ml capacity containing De Jalon solution of the following composition (mM) NaCl 153.85, KCl 5.64, CaCl$_2$ 0.55, MgSO$_4$ 0.08, NaOH 12.5 and glucose 2.78. The physiological salt solution was maintained at 37°C and continuously aerated with carbogen (that is, 5% carbon dioxide + 95% oxygen gas mixture). Each preparation was subjected to a resting tension of 1.0 g and allowed to equilibrate for 30 min before it was challenged with *L. taraxacifolia* / other drugs used.

**Drug challenges**

After an equilibration period of 30 min, normal myometrial contractions were recorded at baseline. Uterine contractile responses were elicited by adding oxytocin (0.4 µg/ml), acetylcholine (0.4 µg/ml), histamine (0.4 µg/ml) and aqueous extract of *L. taraxacifolia* (400, 800 and 1800 mg/ml) to the De Jalon's solution. Each dose of the drug was allowed to act for 10 min and the amplitude of the contraction recorded by means of an isotonic transducer connected to a single channel recorder which was calibrated to record change in the tension generated on g versus displacement basis. Piroxicam (0.4 µg/ml), atropine (0.4 µg/ml) and mepyramine (0.4 µg/ml) were then used to antagonize the responses of the isolated uterus to oxytocin, acetylcholine or histamine and to the aqueous extract of *L. taraxacifolia*.

**Statistical analysis**

Results were expressed as mean ± standard error of mean (SEM). Data was analysed using student t-test. P<0.05 was considered to be statistically significant (Figure 1).

**RESULTS**

**Percentage yield**

The percentage yield obtained for the aqueous extract of the whole plant of *L. taraxacifolia* was 17.38%.

**Preliminary phytochemical analysis**

The result of the preliminary qualitative phytochemistry showed the presence of carbohydrate, saponins, tannins, flavonoids and steroids.

**Acute oral toxicity**

At a limit dose of 2000 mg/ml, all the rats in the short and long term observation survived and no mortality or obvious signs of toxicity was recorded after the 14 day observation period. The LD$_{50}$ is therefore more than 2000 mg/ml.

**Dose dependent effect of *L. taraxacifolia* on uterine contraction on non-pregnant rats**

Aqueous extract of *L. taraxacifolia* evoked a dose dependent contraction of the uterine smooth muscle. In the control, the force of contraction recorded was 0.58 g, which was the baseline contraction in oestrogenised rat's uteri. At 400 mg/ml, the force generated was 1.469 times greater than the control. Meanwhile, the force increased by 1.624 and by 1.793 times, following administration of 800 and 1600 mg/ml *L. taraxacifolia*, respectively, with 1600 mg/ml *L. taraxacifolia* producing the maximum tension (Emax). The agonists used also elicited contractions of varying degree with oxytocin having the highest amplitude, with a force of contraction 1.577 times greater than the control while the force increased by 1.272 and 0.567 for acetylcholine and histamine, respectively. The dose of *L. taraxacifolia* that produced the Emax (1600 mg/ml) showed a force of contraction greater than that of 0.4 µg/ml oxytocin. This is shown in Figure 2.

**Effect of atropine, mepyrraine and piroxicam on the Emax induced by 1600 mg/ml *L. taraxacifolia* in non-pregnant uterine strip**

In Figure 3, administration of muscarinic receptor antagonist, atropine into the bathing solution containing isolated uterine tissue pre-exposed to 1600 mg/ml *L.

Uteri contractile response to LH in the presence of known uteri receptor antagonists (Piroxicam, atropine, mepyramine)

**Figure 1.** Flow chart of methodology.

taraxacifolia resulted in the Emax decreasing by 0.17 times. Meanwhile, administration of a histamine H1 antagonist mepyramine resulted in the Emax decreasing by 0.16 while a prostaglandin (PG) inhibitor, piroxicam an antagonist of oxytocin completely abolished its effect.

**Dose dependent effect of L. taraxacifolia on uterine contraction on pregnant rats**

The aqueous extract of *L. taraxacifolia* also evoked a dose dependent contraction of the uterine smooth muscle obtained from pregnant uterus in the third trimester (day 18 gestation). In the control, the force of contraction recorded was 0.60 g, which was the baseline contraction in pregnant rat’s uteri. At 400 mg/ml, force generated was 1.36 times greater than the control. Meanwhile, the force increased by 1.51 and by 1.66 times, following administration of 800 and 1600 mg/ml *L. taraxacifolia*, respectively. The agonists used also elicited contractions of varying degree with oxytocin having the highest amplitude, with a force of contraction 2.19 times greater than the control while the force increased by 0.755 and 0.69 for acetylcholine and histamine, respectively. The amplitude of contraction obtained with *L. taraxacifolia* and acetylcholine in the pregnant rats uterine strips were lower than that obtained in the non-pregnant rats. However, for oxytocin and histamine the forces of contraction in the pregnant rat uterine strip were 0.28 times and 0.11 higher than that obtained in the non-pregnant rats, respectively. This is presented in Figure 4.

**Effect of atropine, mepyramine and piroxicam on the Emax induced by 1600 mg/ml L. taraxacifolia in pregnant rat uterine strip**

In Figure 5, administration of muscarinic receptor antagonist, atropine into the bathing solution containing isolated uterine tissue pre-exposed to 1600 mg/ml *L. taraxacifolia* resulted in the Emax decrease by 0.12 times. Meanwhile, administration of a histamine H1

(B) Tracing of isometric uterine contraction following administration of various concentration of *L. taraxacifolia*. (C) Mean tension generated from isolated uterine horns obtained from different oestrogenized rats, which were exposed to various doses of *L. taraxacifolia* at concentrations ranging between 400 to 1600 mg/ml and different agonists. There was a dose-dependent increase in the tension with increasing doses of *L. taraxacifolia*. n=5 (* p<0.05 as compared to control).
Figure 3. The effect of selected receptor antagonists on *L. taraxacifolia*-induced uterine contraction. (A) Representative tracings of isometric uterine contraction following *L. taraxacifolia* administration in the presence of various antagonists. (B) Mean Emax following administration of *L. taraxacifolia* at 1600 mg/ml in the presence of atropine, mepyramine and piroxicam. Atropine caused the least inhibition followed by mepyramine. Piroxicam completely abolished the effect of *L. taraxacifolia*.

Figure 4. Comparison of mean tension generated from isolated uterine horns obtained from different non-pregnant and pregnant rats, which were exposed to various doses of *L. taraxacifolia* at concentrations ranging between 400 to 1600 mg/ml and different agonists. *L. taraxacifolia* showed a higher uterotonic effect on non-pregnant rats’ uterus while effect of oxytocin and histamine were higher on pregnant rats uterus.

Antagonist mepyramine resulted in the Emax decreasing by 0.09 while a prostaglandin (PG) inhibitor, piroxicam completely abolished its effect as obtained in the non-pregnant rats uterine strips.
Relative potency of *L. taraxacifolia* as uterotonin

In Table 1, the relative potency of *L. taraxacifolia* was compared to other uterotonin. *L. taraxacifolia* at 1600 mg/ml was 0.08 times more potent than 0.4 µg/ml oxytocin in the non-pregnant rat uterine strips. The Emax produced following administration of 1600 mg/ml *L. taraxacifolia* on non-pregnant rats uterine strip was 1.620 ±0.048 g. Meanwhile, the Emax produced following administration of 0.4 µg/ml oxytocin, 0.4 µg/ml acetylcholine and 0.4 µg/ml histamine were 1.495±0.053, 1.318±0.032 and 0.909±0.046 g, respectively. In the pregnant rat uterine strip, however, oxytocin was 0.17 times more potent than 1600 mg/ml *L. taraxacifolia*

**DISCUSSION**

This study has shown the uterotonie effect of aqueous extract of *L. taraxacifolia* and the possible mechanism of action. To the best of our knowledge, this study is the first to display this effect, which justifies the claim that this plant eases birthing process and alleviates labour pain. *L. taraxacifolia* at 1600 mg/kg was 0.08 times more potent than oxytocin, which is a gold standard uterotonin (Sheldon et al., 2012) in non-pregnant rats. This was however not the case with the pregnant rat uterus. The reason for this is not fully understood but may be due to the presence of different component in the crude extract used, some of which may even have antagonistic effect. Chan et al. (1988) reported that in gravid uterus, just prior to term labour, the parturient uterus usually becomes highly active and responsive to oxytocin. The agonist (oxytocin), been a pure compound will therefore likely result in greater uterine contraction.

The results obtained showed that *L. taraxacifolia* effect is mediated via muscarinic, oxytocin and histamine receptors. The presence of these receptors in the uterus has been previously established (Hay et al., 2010; Abdalla et al., 2004; Kobayashi et al., 1999). These mechanism were confirmed from inhibition of Emax produced by 1600 mg/ml *L. taraxacifolia* following administration of the antagonists to these receptors. Our findings suggest that LH-induced uterine contraction was mediated mainly via the oxytocin receptor. This is because piroxicam, an antagonist of oxytocin completely
abolished the effect of the aqueous extract. Moderate inhibition of the Emax by atropine and mepyramine suggest that LH binding to muscarinic and histamine receptors produced a moderate degree of contraction. There is a possibility that the greatest effect of L. taraxacifolia produced following it binding to the oxytocin receptors (as evidenced by the complete inhibition of the Emax by piroxicam) was due to a high number of this receptor expression in the uterus. Previous studies have shown that of all the receptors reported to be present in the uterus, the oxytocin receptor expression in the uterus is the highest (Sanborn, 2001; Grigsby et al., 2006). This is however, not the case with F. asperifolia which elicited uterotonic activity via the histamine receptor (Watcho et al., 2011), M. cecropioides, M. ciliatum and Agapanthus africanus which elicited their uterotic activity significantly via the muscarinic and oxytocin receptors (Uguru et al., 1998; Ayinde et al., 2006; Veale et al., 1999), and Ananas comosus which elicited its uterotonic activity through serotonergic pathway (Monji et al., 2016; Monji et al., 2018).

Pharmacological activities observed in plant extracts are due to the presence of various secondary metabolites they contain (Ayinde et al., 2006). The observed uterine contractility effect in this extract is invariably due to these secondary metabolites. The phytochemical analysis of L. taraxacifolia revealed the presence of saponins and steroids both of which have been shown to possess uterine stimulating effect (Watcho et al., 2011; Guo et al., 2008). Similar investigation of different plants with uterotonic properties including F. asperifolia (Watcho et al., 2011; M. ciliatum (Uguru et al., 1998), M. cecropioides (Ayinde et al., 2006) and Nymphaea alba (Bose et al., 2014) all revealed the presence of saponins, tannins, flavonoids and steroids.Tannis, flavonoids and saponins have been shown to be present in uterotonics plants such as Ficus deltoidea (Amiera et al., 2014) and Calotropis procera (Shamaki et al., 2015). Tannis are thought to elicit their uterotonic effect through affecting calcium availability for uterine tissue and cardiac muscle contraction (Polya et al., 1995; Calixto et al., 1986) while flavonoids, on the other hand, act directly on oestrogen receptors to cause uterine contraction (Revuelta et al., 1997).

The oral acute toxicity studies show that it is safe and well tolerated in rats as no sign of toxicity was observed in all the treated animals. A study which assessed the safety of the ethanol extract of L. taraxacifolia in rodents revealed no negative effect on physical, hematological and serum biochemical parameters when doses ranging from 10-5000 mg/kg were administered (Kuatsienu et al., 2012). The findings in this study suggest that the use of L. taraxacifolia should be contra-indicated in pregnancy. It however authenticates the folkloric obstetric use of the plant for the induction or acceleration of labour as well as expelling retained placenta among pregnant women in Sokoto, North-west Nigeria.

**CONFLICT OF INTERESTS**

The authors have not declared any conflict of interests.
