

Editorial

Environmental Education and Research in Africa

In his formidable account of science in Africa¹, Thomas Bass inspires aspiring scientists to work in Africa:

“African is a scientific treasure house. Endowed with fabulous examples of physical and cultural diversity, it pushes the boundaries of the known world.....Africa is a limit case. It offers scientists the most extreme examples of theoretical problems posed in various disciplines, ranging from human evolution and the evolution of species in general to the theory of famine, the spread of deserts, the rise of new viruses, and the special problems of tropical entomology and tropical agriculture.”

Given this reputation for opportunity for scientific discoveries and their applications for solving pressing societal problems, many have questioned why the local production of tangible benefits of science and technology remain negligible compared to the rest of the world. David Livingstone has told us that geography matters indeed for scientific knowledge production and interpretation, but in that treatise, references to Africa is relegated to Europeans bringing illuminating science to the “dark continent.”² For the most part, African countries have adopted the scientific method, at least in terms of formal education, if not in cultural practices and beliefs. But where is the science being done, and who is doing it?

Institutions of higher education, particularly universities remain the places that can afford the luxury of basic scientific research – the search for the nature of things without particular attention to utilitarian values (Figure 1). It is increasingly difficult to fund such research, especially because we have not done well to translate scientific knowledge into societal benefits. Therefore, it will be difficult to request hard earned tax-payers monies to support endless inquiries. The relationship between basic science and environmental technology is particularly relevant to the challenges that face many African countries. There is no doubt that we should all work hard to increase participation of African institutions in science, and to encourage entrepreneurs to translate scientific knowledge – wherever it is produced – into technological solutions. The Association of African Universities (AAU) lists 212 member institutions in 45 countries³.

A search of the database maintained by AAU revealed that 222 programs focus on “science” whereas 176 represent “technology”, and 169 include “environmental” topics. Specifically, environmental science is represented in 162 occasions, and environmental technology is represented in 90 occasions. Table 1 presents graduate theses and dissertations that include “environment” as a keyword from 1986 to 2007. We present the entire database here to salute those who completed the research, but also to serve as inspiration for those who may gain ideas from a review of topics covered and topics omitted.

The information presented in the Table show a wide diversity of topics and specialization, all relevant to environmental science and technological solutions for the African situation. The issues seem not to be the lack of interest or action in science, but of translational science and entrepreneurial investment. We invite those who read their own names in Table 1 to write and tell us how they have worked to translate their research into action to improve the African quality of life.
