Many pathological conditions are associated with pain, fever and inflammation. Synthetic drugs available for the treatment of these ailments accompany many unwanted side effects; most prominent of which is the gastric ulcer. Present study was thus aimed at evaluating the analgesic, anti-pyretic and anti-inflammatory potential of aqueous methanolic extract of leaves of plant Jatropha gossypifolia. Anti-inflammatory activity was evaluated using carrageenan induced paw edema. Acetic acid induced writhing test and hot plate method was used to assess the analgesic activity. Anti-pyretic activity was ascertained using brewer’s yeast induced pyrexia. The aqueous methanolic extract of the plant J. gossypifolia have demonstrated significant analgesic, anti-pyretic and anti-inflammatory activity at 200 mg/kg dose. The data was statistically analyzed by one way ANOVA followed by post hoc Dunnett’s test for multiple comparisons. It has thus concluded that aqueous methanolic extract of leaves of plant J. gossypifolia possess analgesic, anti-inflammatory and anti-pyretic properties. These results strongly support the ethno-pharmacological use of this plant as anti-pyretic, analgesic and anti-inflammatory agent.

Key words: Jatropha gossypifolia, anti-inflammatory, analgesic, anti-pyretic.

INTRODUCTION

Plant derived chemicals have been used by men for centuries as a source of medicine (Semwal et al., 2010). A large in number of the population in Pakistan has been using these medicinal plants as their primary source of...
The rats were maintained in paper and DMSO was used as control tract of group. All rats were deprived of feed 1 h before experimentation. Group I rats were treated with DMSO liquid as negative control, group II rats were treated with standard drug indomethacin 10 mg/kg body weight through intra-peritoneal route respectively. After 1 h of administration of DMSO, indomethacin and plant extract all the rats were injected with 1% acetic acid solution intra-peritoneal. The number of writhing was counted for 20 min after acetic acid injection as described by (Hajare et al., 2000).

**Hot plate test**

Experimental rats were acclimatized to laboratory conditions and were randomly divided into five groups consisting of 4 rats in each group. Animals were deprived of feed 1 h prior testing procedure. All the rats were pre-tested for measuring the latency time on hot plate which was maintained at 55±2°C. Animals showing latency time greater than 15 s were rejected from the experiment. Group I received control DMSO liquid 10 ml/kg, group II received tramadol 20 mg/kg and III, IV and V groups received J. gassypifolia leaves extract 50, 100 and 200 mg/kg body weight respectively. Latency time of lifting the paw was then noted by placing each rat on the hot plate maintained at 55±2°C at 0, 20 and 60 minutes after treatment as described by Hajare et al. (2000).

The analgesia percentage was then calculated using the formula:

\[
\text{% Analgesia} = \left( \frac{\text{Test latency-Control latency}}{\text{cut off time-controlled latency}} \right) \times 100
\]

**Anti-inflammatory activity**

**Carrageenan induced paw edema**

The anti-inflammatory activity of aqueous methanolic extract of leaves of the plant J. gassypifolia was determined using carrageenan as inflammatory mediator (Amdekar et al., 2012). Albino rats (aging between 40 and 50 days) of species Rattus norvegicus were divided into five groups consisting of 4 rats in each group. All rats were deprived of feed 1 h before experimentation. Group I rats were treated with DMSO liquid as negative control, group II rats were treated with standard drug indomethacin 10 mg/kg body weight, group III, IV and V were treated with J. gassypifolia extract 50, 100 and 200 mg/kg body weight respectively. After 1 h of intra-peritoneal injection of all the groups, 1% carrageenan solution of approximately 0.5 ml was injected into the left hind paw of each rat. Paw volume of each rat was measured immediately at 0 h and after 3 h of carrageenan immersion injection using liquid immersion method (Fereidoni et al., 2000). The average paw edema in plant...

The data was analyzed by one way ANOVA followed by post hoc Dunnett’s test for multiple comparison the data are reported as mean ± S.E.M for group of 4 animals. Asterisks indicated the statistically significant values as compared to control p <0.05.

Percentage analgesia was calculated using the following formula:

\[
\text{Percentage Analgesia} = \left(\frac{\text{test latency} - \text{control latency}}{\text{cut off time} - \text{control latency}}\right) \times 100
\]

Anti-inflammatory effect of plant extract

In carrageenan induced paw edema the plant extract of J. gossypifolia showed dose dependent anti-inflammatory activity. The maximum anti-inflammatory activity of the plant extract J. gossypifolia was found at a dose level of 200 mg/kg of about 53% (Figure 1) as compared with the reference drug indomethacin 10 mg/kg where the anti-inflammatory activity was 79% (Table 3).

Anti-pyretic effect of the plant extract

The plant extract at 200 mg/kg showed significant anti-pyretic activity in brewer’s yeast induced pyrexia in...
The rectal temperature of rats was recorded at 0, 1, 2, 3 and 4 h after the drug treatment (Figure 2). The results thus depicted that the aqueous methanolic extract of *J. gassypifolia* leaves illustrated significant anti-pyretic activity (65%) at dose of 200 mg/kg comparable to the reference drug paracetamol which was 85% (Figure 3) at a dose of 150 mg/kg (Table 4).

**DISCUSSION**

Results of the present study revealed that leaves of the plant *J. gassypifolia* possess significant analgesic, anti-pyretic as well as anti-inflammatory activity. Carrageenan induced edema is known to be the acute inflammatory model; sensitive to the cyclooxygenase inhibitors and is used to find the effects of non-steroidal anti-inflammatory agents which inhibit cyclooxygenase involved in prostaglandin synthesis. Although both pathways, that is, cyclooxygenase and lipoxygenase are involved in mediating inflammatory process but cyclooxygenase inhibitors are considered more effective than lipoxygenase inhibitors (Ndebia et al., 2007). Carrageenan induced paw edema model is well

![Figure 2. Effect of intraperitoneal administration *J. gassypifolia* aqueous methanolic extract 50, 100 and 200 mg/kg in yeast induced pyrexia in rats. established technique for the estimation of anti-inflammatory activity for plant derived natural substances as well as for synthetic drugs. The edema formation is a two phase process; the initial phase of edema involves the action of inflammatory mediators on the vascular permeability, including histamine, serotonin and bradykinin (Toni et al., 2015). The second or the later phase involves the pain mediators like prostaglandins (Chao et al., 2009). Pre-treatment of experimental animals with respective concentration of plant extract reflects that the plant extract was effective in attenuating the early phase of inflammation which involves the release of inflammatory mediators like histamine, serotonin and bradykinin (Muhammad et al., 2012). When the edema was induced by injecting 1% carrageenan solution into the left hind paw of all the experimental rats (Gupta et al., 2003), the aqueous methanolic extract of *J. gassypifolia* showed significant anti-inflammatory activity in both phases of inflammation at a concentration of 200 mg/kg body weight (Figure 1).

The analgesic activities of plant derived natural substances are usually evaluated using acetic acid induced writhing test model (Kumar et al., 2015). The pain induction is caused by the release of certain endogenous substances e.g. bradykinin and also from the production of pain mediators like arachidonic acid via cyclo-oxygenase pathway and prostaglandin synthesis (Verma et al., 2015). Abdominal writhing usually involves certain pain receptors which are located in the peritoneum (Mbiantcha et al., 2011). When peripheral analgesic activity was determined by acetic acid induced writhing test as described by Hugar et al. (2010), the results demonstrated that the plant extract of *J. gassypifolia* significantly reduces the abdominal writhing in rats at a dose of 200 mg/kg indicating its activity on local peritoneal pain receptors (Table 2).

The hot plate method is a common technique usually used in measuring the central analgesic effects (Singh et al., 2015). The results showed that the plant extract of *J. gassypifolia* at a concentration of 200 mg/kg body weight significantly increased the latency time of lifting the paw which is comparable to tramadol 20 mg/kg used as control. The increase in latency time of lifting the paw as compared with the negative control reflected the decrease in pain threshold which might be due to the inhibition or suppression of thermo receptors in the brain region. The plant extract *J. gassypifolia* at 200 mg/kg dose showed 58% increase in latency time of lifting the paw as compared to the standard drug tramadol which reflected 93% increase in latency time at a dose level of 20 mg/kg (Table 2).

Administration of 20% yeast suspension below the
nape of the neck to the experimental animals induces pyrexia possibly by increasing the synthesis of prostaglandins (Eldahshan and Abdelaim, 2015). The induction of fever by this method is called pathogenic fever. Induction of pyrexia or fever involves liberation of several mediators and hence antipyretic effect can only be achieved by inhibiting or blocking the release of these mediators. In present study, the plant extract of J. gassypifolia has shown its significant anti-pyretic activity (65%) at dose level of 200 mg/kg indicating the presence of chemicals in plant extract that are involved in the inhibition of prostaglandins synthesis confirming the plants potential as antipyretic agent (Figure 3 and Table 4).

In conclusion the extract of the plant J. gassypifolia was proved to be a natural and effective remedy for the treatment of pain, inflammation and fever. The study has thus justified the folk use of the J. gassypifolia plant extract as a remedy for clinical signs, including pain, inflammation and fever on scientific basis and may require further isolation of active ingredient out of extract for the advancement in pharmaceutical sciences.
