Current technology issues

The challenges we face today may not differ much from those our ancestors faced before, except for one thing, they come faster. Current technology provides a timely and open access to information from all over the world. This new online journal is an excellent vehicle for young scholars to disseminate their work globally. It is timely and fitting as it reflects the increasingly pluralistic and uncertain global economy.

The editors and board members urge graduate students, recent post doctoral students, new faculty, and researchers to submit their work that cover the following areas: economic development, agricultural economics, urban and/or rural development, housing economics, regional and local public finance, poverty, as well as projects that address race, ethnic or gender disparities. We are also looking forward to including articles on natural resource optimization, environmental goods evaluation, forestry, husbandry, fishery, application of new technologies and research methods in statistics, econometrics, and Geographic Information System (GIS). Articles that are transdisciplinary and multicultural in approach and coverage are strongly encouraged.

Dream bigger and together, we go further.
